#### INTRODUCTION

1.

This document is the Closure Report prepared as part of the Agreed Order requirements for closure of wastewater sumps at Longhorn Army Ammunition Plant. The purpose of this report is to document the information gathered during the field investigation characterizing waste, waste disposal, sump decontamination, sump disposal, and final sump status.

The closure of wastewater sumps was initiated by the "Closure Plan for Wastewater Sumps, May 1995", required by item 1 of the Agreed Order between the Department of the U.S. Army and the Texas Natural Resource Conservation Commission on 16 November 1995.

The closure of 29 active sumps and 11 transition sumps was begun after TNRCC approval of the Closure Plan for Wastewater Sumps dated 27 June, 1995. The closure procedure, as required by the Agreed Order involve only the sumps and their contents. Delineation and remediation of any releases from the sumps will be completed in accordance with the Federal Facility Agreement and applicable RCRA regulations.

Active and transition sumps have been closed as required by the closure plan with the exception of one unit. This unit, NOR number 154 was actually a weir at the laundry. As approved by the TNRCC on 11 October 1995, this unit was removed from any closure requirements. Correspondence concerning the laundry weir is provided in volume III of this closure report.

#### 1.1 Organization of Report Content

Volume I of this report contains a general description of the sump closure methodology and supporting documentation for the overall project. All tables, figures, and appendices are provided in volume I.

Volumes II, III, and IV contain a specific description of the work done and the supporting documentation for the closure of each sump. The contents of volumes II, III, and IV are separated into a section for each sump. Volumes II and III provide data on "Active" sumps and volume IV provides data on "Transition" sumps. Below is a list of the supporting documentation for closure in each section on a specific sump.

#### Section Contents

Sump Closure Certification Work Done Waste Determination Summary Sheet Concrete Determination Summary Sheet Location Map Sump Structural Drawing Analytical Results Chain of Custody Reports

#### **1.2 LHAAP Location**

LHAAP is located on the northwest shore of Caddo Lake in northeast Texas. The plant is adjacent to the communities of Karnack and Uncertain and 14 miles northeast of Marshall, Texas and 40 miles west of Shreveport, Louisiana. Figure 1 illustrates the plant's location relative to the state of Texas and more specifically Marshall, Texas.

#### 2.0 DESCRIPTION OF FIELD WORK

Field work began immediately upon receipt of the approval letter from the TNRCC (Appendix A). As the first order of business trenches to each sump were blocked off with concrete to prevent stormwater runon infiltration prior to any work being done. The prevention of stormwater entering the sumps minimized the quantity of wastewater being generated. The sumps were then sampled, decontaminated, and removed or filled with dirt as specified in the closure plan.

### 2.1 Wastewater and Sludge Sampling Methodology

Liquid and sludge samples were removed from each sump to analyze for volatile organic compounds, semi-volatile organic compounds, and RCRA metals. In addition specific samples were analyzed for explosives, isophorone diisocyanate (IPDI), and total petroleum compounds at

areas where the sumps might have been contaminated with these items. Appendix IX of the Closure Plan for Wastewater Sumps presents a list of the sumps where additional sampling and analysis was conducted. Samples were pulled from locations as specified by the closure plan. All nondisposable equipment was decontaminated by washing with Alconox and rinsing with water, final rinsing with de-ionized water, and finishing with a hexane spray prior to collecting samples.

Quality Assurance/quality control (QA/QC) samples were collected to verify that the sampling and analytical techniques were being performed properly. Equipment blanks were taken at regular intervals to insure proper decontamination of equipment. Trip blanks were sent in with each shipment of samples to check the performance of the laboratory. No QA/QC samples showed any detectable levels of any contaminant. Analytical results for all QA/QC samples are located in Appendix C.

#### 2.2 Waste Disposition

1

Waste Disposition Summary Sheets were prepared for each sump to identify waste constituents in each sump and to determine the proper disposition of the waste. The waste disposition summary sheet is simply a summary of the analytical data from the laboratory and a waste determination on a single page. This summary sheet was used in the field by the equipment operators and technicians to correctly label and route the waste to its proper location. Summary sheets are included in this report in each section on specific sumps.

Liquid wastes were removed with a vacuum truck. If the wastewater was determined hazardous, it was shipped offsite to a TSD facility. If the wastewater was determined to be non-hazardous it was treated by evaporation at the onsite wastewater treatment plant.

Immediately after the removal of liquids from the waste unit, sludge's were removed and placed into 30-gallon drums. A backhoe with a small bucket was utilized to remove the bulk of the waste from the sump and long handles shovels removed the sludge residue from the sump. Plastic was spread on the ground to capture any sludge that spilled during containerization. A large funnel was placed into the 30-gallon drums to facilitate transfer of the sludge from the backhoe bucket to the drum without spills. During sludge removal operators were not allowed to enter the sump at any SUMP CLAND PROJECT WASTE GENERATED

TABLE 1

time. Operators did not enter any sump until the sump was emptied and washed with high pressure water. Sumps were entered upon clearance from the safety officer.

Sludge determined to be potentially reactive was treated at the Longhorn AAP Burning Ground. The ash residue from the deactivated sludge was sampled and analyzed for constituents that were in the sludge that was treated. If the ash exhibited levels of metals as determined by a TCLP test, it was treated and landfilled in a hazardous waste landfill. Ash that exhibited any level of a Flisted solvent was treated if required and landfilled in a hazardous waste landfill.

#### 2.3 Sump Decontamination

After removal of bulk sludge and residues from the sump, the unit was washed with high pressure water from a portable pump. Rinsewater was collected and analyzed for hazardous constituents prior to disposal. Results from decontamination water analysis are located in Appendix C. Treatment of rinsewater was handled the same as liquid wastes removed from the sumps.

Selected sumps were blasted with carbon dioxide pellets to remove potentially reactive residues from sump walls. Residue removed during the dry-ice blasting process was disposed in accordance with the sludge removed from the sump.

#### 2.4 Concrete Sampling Methodology

After all sumps were decontaminated, concrete samples were spalled from the sump in accordance with the closure plan. Samples were spalled with an pnuematic chisel. The samples were collected in a one-liter jar and shipped on ice to the laboratory. The samples were analyzed for total volatile organic compounds, semi-volatile organic compounds, and 8-RCRA metals.

#### 2.5 Sump Concrete Disposal

Concrete spalled from sumps that contained detectable levels of F-listed solvents were considered hazardous. These sumps were removed and shipped to a hazardous waste landfill. Areas where the sumps were removed were backfilled with clean soil. Sumps that contained F-listed solvents above Land Disposal Restriction (LDR) levels were treated by microencapsulation to meet those standards. Sumps that contained F-listed solvents below LDR levels were certified and landfilled without microencapsulation. Hazardous waste sumps were disposed of at USPCI-Lone Mountain,

a Laidlaw facility in Waynoka Oklahoma. A State of Oklahoma one-time disposal plan is included in Appendix A.

Sumps that were not EPA hazardous and did leach semi-volatile compounds were compared to the Texas Waste Classification rule 30 TAC 335.521, Table 1. The sumps were classified accordingly, removed and landfilled at the Pinehill Landfill in Kilgore, Texas. A copy of an Authorization for Disposal of a Special Waste is included in Appendix A.

Concrete containing RCRA metals at levels 20 times greater than the EPA hazardous level were analyzed for that metal utilizing the TCLP. If the results were non-hazardous in accordance with EPA guidelines and less than background as determined by the Longhorn AAP Soil Background Survey, they were filled in place with clean soil. All active and transition sumps that did require additional TCLP testing did not exhibit leachable levels of metals above the background levels.

To determined typical levels of metals in "clean" concrete, a sample was taken from an outside wall at building 54-H. Levels of total metals in the sample were very similar to levels taken from sumps that had been decontaminated. Results of the analysis are located in Appendix E

Concrete determined to not contain a F-listed solvent, but did contain a semi-volatile solvent such as Di-n-butylphthalate, a common ingredient in plastic and paint, were tested for leachability using the TCLP procedure. If the analysis was non-detect for these constituents the sumps they were filled in place as non-hazardous sumps in accordance with the closure plan.

EQL is Estimated Quantitation Limit. The EQL takes into account the Instrument Detection Limit (IDL), Method Detection Limit (MDL), and Practical Quantitation Limit (PQL). Our analytical result must be above our EQL before we report a value for any parameter. Otherwise, we report ND (Not Detected above EQL).

These analytical results relate to the sample tested. This report may not be reproduced except in full without written approval of Ana-Lab Corp.

I certify that the results were generated using the above specified methods.

Ph.D., President teside,

SUBJECT: Closure of Sumps at Longhorn Army Ammunition Plant

Ms. Lila Beckley Texas Natural Resource Conservation Commission TNRCC MC-128 Post Office Box 13087 Austin, TX 78711-3087

Dear Ms. Beckley:

Waste water sumps at Longhorn Army Ammunition Plant have been removed and properly disposed. As part of the removal action, portions of drainage troughs were also removed and disposed.

Remaining concrete drainage troughs and other related components are to be investigated as part of the Phase III, Group 4 Remedial Investigation. This investigation will include soil and groundwater in the immediate area of the troughs and sumps. Trough contents (i.e. dried sediment) and surrounding soils will be investigated for indication of historical use related leaks or spills.

The point of contact is Ms. Yolane Hartsfield, 918-669-7530.

Sincerely,

am April he

JAMES A. McPHERSON Commander's Representative

CF: TNRCC (Diane Poteet)

# **TEXAS NATURAL RESOURCE CONSERVATION COMMISSION**

Protecting Texas by Reducing and Preventing Pollution

February 28, 1997

Mr. Ira C. Nathan, Chief, Operations Review Division Longhorn Army Ammunition Plant Attn: SIOLH-OR P.O. Box 658 Doyline, LA 71023

Re: Longhorn Army Ammunition Plant (LHAAP) Solid Waste Registration No. 30990 Closure Report for 29 Active (Group 1) and 11 Transition (Group 2) Sumps Approval of Report

Dear Mr. Nathan:

The staff of the Texas Natural Resource Conservation Commission (TNRCC) has completed a review of the four-volume report referenced above. This report, received by the TNRCC on September 30, 1996, was submitted as required by Ordering Provision Nos. 1 and 13 of the December 4, 1995 Agreed Order. According to LHAAP representatives, the report for the remaining sumps addressed in the closure plan, the Group 3 (85 DERA) sumps, will be submitted within the next few months.

The September 1996 report documents activities conducted pursuant to the May 1995 *Closure Plan* for Wastewater Sumps, approved with modifications by TNRCC letter of June 27, 1995. As stated previously in various correspondence, both the closure plan and the sump closure requirements of Ordering Provision No. 1 of the Agreed Order address the sumps themselves and their contents. Although decontamination goals for the sumps were laid out in the closure plan, final determination of closure standards (i.e., 30 Tex. Admin. Code Chapter 335 Subchapter S and applicable RCRA requirements) should be made after assessment of the media surrounding the sumps and any remaining sump system components (e.g., troughs). As stated in your letter of February 19, 1997, investigation of these remaining areas will be completed as part of the upcoming Phase III, Group 4 Remedial Investigation.

In general, the approved plan entitled *Closure Plan for Wastewater Sumps* required classification and disposal of the sump contents, sump decontamination and, if necessary, sump removal. According to the report, 13 of the 29 Active sumps and 6 of the 11 Transition sumps were Mr. Ira C. Nathan Page 2

removed for off-site disposal. The remaining decontaminated sumps, as well as the excavated areas where sumps had been removed, have been backfilled with clean fill.

Based on a review of the September 1996 report and other relevant information provided by LHAAP representatives, it appears that the activities conducted generally conformed with the specifications in the approved plan. The report, therefore, is approved.

As a reminder, after completion of formal closure activities and acceptance by the TNRCC of the appropriate closure certifications and other documentation, LHAAP should make any necessary updates to its Notice of Registration, particularly for the solid waste management units affected by the closure activities.

Please be aware that it is the continuing obligation of persons associated with a site to assure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 Tex. Admin. Code Section 335.4. If the actual closure fails to comply with these requirements, the burden remains on LHAAP to take any necessary and authorized actions to correct such conditions.

If you or your representatives have any questions regarding this matter, please contact Lila Beckley of I&HW Team I at (512) 239-2130 or at Mail Code 128 at the letterhead address.

Sincerely,

the Kennert

Cathy Remanert, Senior Coordinator I&HW Team I, Waste Section Enforcement Division

# MEMORANDUM OF AGREEMENT BETWEEN THE DEPARTMENT OF THE ARMY AND THE DEPARTMENT OF THE INTERIOR FOR THE INTERAGENCY TRANSFER OF LANDS AT THE LONGHORN ARMY AMMUNITION PLANT FOR THE CADDO LAKE NATIONAL WILDLIFE REFUGE HARRISON COUNTY, TEXAS

This Memorandum of Agreement ("MOA") provides for the permanent terms and conditions for the Transfer of Property at the Longhorn Army Ammunition Plant ("LHAAP"), Harrison County, Texas, from the Department of the Army ("Army"), through the General Services Administration ("GSA"), to the Department of the Interior, U.S. Fish and Wildlife Service ("FWS"). The FWS requested all of LHAAP during the federal screening process. LHAAP consists of approximately 8,400 acres (see Exhibit 1).

The FWS intends to accept the Property through the process outlined in this MOA and the GSA transfer process. As part of this process, the Army will hold the specific parcels of the Property until a parcel becomes a Candidate Parcel. Once a parcel becomes a Candidate Parcel, the Army shall offer the parcel for transfer to FWS subject to the terms and conditions of this MOA.

The Army reported LHAAP to the GSA as excess real property. Through an agreement between Army and FWS dated October 21, 2000, Army authorized FWS to undertake wildlife and habitat management activities at LHAAP while the Army continues with remediation activities. Pursuant to the October 21, 2000, agreement, FWS established the Caddo Lake National Wildlife Refuge as an "Overlay Refuge," pending the ultimate disposition of LHAAP (see Exhibit 2 – Overlay Refuge Map).

The Caddo Lake National Wildlife Refuge is established to protect one of the highest quality old-growth bottomland hardwood forests in the southeastern United States, and associated wetlands. The mission of the National Wildlife Refuge System ("Refuge System") is to administer lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans [16 U.S.C. 668dd(a)(2)]. The Secretary of the Interior will ensure that the biological integrity, diversity, and environmental health of the Refuge System resources are maintained and that wildlife-dependent recreational uses will receive priority consideration as required by the National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd(a)(4)]. The environmental response actions taken on wildlife refuges must be protective of human health and the environment.

The authorities for the transfers covered by this MOA include the Federal Property and Administrative Services Act of 1949 (40 U.S.C. 471-535) as amended, the Fish and Wildlife Coordination Act (16 U.S.C. 661- 666c), the Fish and Wildlife Act of 1956 (16 U.S.C. 742a-

#### CADDO LAKE OVERLAY NATIONAL WILDLIFE REFUGE

742j), as amended, and the Act of May 19, 1948, Public Law 80-537 (16 U.S.C 667b-667d), as amended.

## I. **DEFINITIONS**

- A. "Army" means the Department of the Army, U.S. Department of Defense.
- **B.** "CLI" means the Caddo Lake Institute.
- C. "Candidate Parcels" means those parcels of the Property that the Army has determined to be suitable for transfer from the Army to FWS under Section III.
- **D. "Environmental Contaminants"** mean any of the following: (1) hazardous substance, pollutant, or contaminant under the Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA"), 42 U.S.C. 9601(14) and (33); (2) petroleum and any petroleum product or derivative; (3) Munitions and Explosives of Concern ("MEC"); (4) Recovered Chemical Warfare Material ("RCWM"); (5) biological warfare agents; or (6) nuclear or radiological material as regulated by the Nuclear Regulatory Commission.
- **E. "FWS"** means the U.S. Fish and Wildlife Service, U.S. Department of the Interior.
- F. "GSA" means the U.S. General Services Administration.
- G. "Land Use Controls" or "LUCs" means any type of physical, legal, or administrative mechanisms used to restrict the use of, or limit access to, real property to ensure that there are no unacceptable risks to human health, safety, or the environment. LUCs consist of Engineering Controls (i.e., physical means of treating, containing or monitoring Environmental Contaminants, or limiting access to a site where contamination remains) and/or Institutional Controls (i.e., non-engineering measures, such as legal or administrative mechanisms, whether temporary or permanent).
- H. "MOA" means this Memorandum of Agreement between the Army and the FWS.
- I. "Overlay Refuge" means those lands within LHAAP under the jurisdiction, custody, and control of the Army, but over which FWS exercises natural resource management activities by agreement with and permission from the Army (see Exhibit 2).
- **J. "Parties"** means the U.S. Department of the Army and the U.S. Fish and Wildlife Service.

- **K.** "**Production Area**" means the area shown as Parcel #1 on Exhibit 1.
- L. "Property" means the former Longhorn Army Ammunition Plant as shown in Exhibit 1.
- **M. "Response Action"** means any action taken in response to Environmental Contaminants, including removal, remedial, corrective, closure, and enforcement actions and associated operation, maintenance, and monitoring actions.
- **N. "Transfer"** means the transfer of administrative jurisdiction, which includes custody of, control over, and accountability for federal interests in real property.
- **O. "Transferred Parcel"** means any parcel transferred by Army, through GSA, to the administrative jurisdiction of FWS.

### **II. PREVIOUS AGREEMENTS:**

- A. Existing Memoranda of Agreements. The Parties have entered into three prior agreements concerning LHAAP and the Caddo Lake National Wildlife Refuge (NWR): (1) Memorandum of Understanding between CLI, FWS, and Army dated September 15, 1999; (2) Memorandum of Agreement signed by Army, FWS and CLI on May 22, 2000; and (3) Memorandum of Agreement between Army and FWS dated October 21, 2000, establishing the Caddo Lake NWR. To the extent any of the prior agreements conflict with this agreement, this Agreement supersedes the prior agreements and controls with respect to Transferred Parcels. The Parties agree that the prior agreements continue to represent the intent and understandings of the Parties in moving toward transfer of the Property, and may be used by the Parties, as appropriate, to interpret the intent of this Agreement. The prior agreements continue to control with respect to overlay refuge areas on LHAAP that have not transferred to the FWS.
- **B. CLI Lease.** The Parties agree that the transfer of certain parcels may be subject to an existing lease between CLI and the Army, first executed in 1996 and amended on August 9, 1999. Unless revoked or terminated prior to transfer, the lease term is from October 1, 1996, through September 30, 2026. The CLI-Army lease (No. DACA63-1-97-0501) encompasses two areas consisting of approximately 1,295 acres and 15 acres. The lease allows CLI to engage in environmental and natural resource education, scientific research, natural and cultural area conservation and protection, and other activities, and contains specific rights and options to lease or purchase, the terms of which are more particularly set forth in the lease documents. The Transfer of the Property shall include the assignment of the Army's lease with CLI to FWS.

- **III. SUITABILITY FOR TRANSFER DETERMINATIONS.** With respect to all LHAAP Candidate Parcels, the Parties shall, to the maximum extent possible, coordinate and cooperate with one another to identify issues and potential disputes and resolve disputes, in advance of making their formal suitability for transfer determinations.
  - A. Clear Title. Before becoming a Candidate Parcel, boundary disputes affecting the Candidate Parcel shall be resolved by the Army in coordination with GSA. FWS may determine a Candidate Parcel is not suitable for transfer if a Candidate Parcel has a title issue or boundary dispute.
  - FWS Suitability for Transfer Determination. The Army shall provide FWS **B**. with technical information that may include, but not be limited to: Technical Letters, Preliminary Assessment/Site Inspection Reports, Proposed Plans and Decision Documents along with supporting documentation, such as Remedial Investigations/Feasibility Studies. For parcels requiring Response Actions, the information will also include a written determination by the EPA that no further Response Action is required or that all remedial actions are operating properly and successfully for the Candidate Parcel offered for transfer. After FWS receipt of documentation from Army, FWS shall determine whether a Candidate Parcel is suitable for Refuge purposes. As part of this determination, the FWS will review the documentation provided by Army. To the extent possible and appropriate, the FWS shall use the information provided by Army in conducting its own environmental site assessment for the Candidate Parcel; however, the FWS may conduct additional contaminants investigation activities as necessary to determine if the Candidate Parcel is suitable for Transfer. Within 90 days following receipt of the documentation provided by the Army, the FWS shall notify the Army, in writing, of its determination on the suitability for transfer of the Candidate Parcel.
  - C. Army Environmental Condition of Property. Upon FWS' determination that the Candidate Parcel is suitable for transfer, the Army shall complete an Environmental Condition of Property ("ECOP") on the Candidate Parcel. The ECOP shall summarize what is known about the environmental condition of the property and shall include supporting documentation. The ECOP shall include a statement by the Army that the Candidate Parcel is suitable for Transfer to FWS. The Army shall provide a copy of the ECOP to FWS.
  - **D. Disputes.** If the Parties disagree on whether a Candidate Parcel is suitable for transfer, the dispute shall be resolved through the Dispute Resolution procedures set forth in Section X of this MOA.

## IV. COORDINATION AND COOPERATION FOR THIRD PARTY TRANSFERS.

The Parties understand that the preferred end state will yield maximum acreage for transfer directly to FWS for refuge management. All of the Property is potentially available to FWS for refuge management. The Army, however, may initiate a third party transfer for (1) Candidate Parcels that the FWS, in accordance with Section III above, determines are not suitable for transfer; and (2) the Production Area. The FWS and the Army agree to fully cooperate with each other in identifying third party recipients for these two categories of property so that the proposed use is compatible with Refuge purposes. The intent is for FWS to be involved in helping the Army find a property recipient that will be a compatible neighbor, to the extent that such a third party transfer arrangement can be reached in accordance with the GSA real property disposal process.

For the Candidate Parcels that FWS determines are not suitable for transfer and for the Production Area, the Army will work with GSA to screen the parcel consistent with the Federal Property Act (40 U.S.C. §471 *et. seq.*) and its implementing regulations. If no further interest is expressed through the required excess property screening process, then a reasonable effort will be made to market such parcels for a conservation conveyance under the provisions of Public Law 107-314, Section 2812 (10 U.S.C. §2694a). After offering a parcel for conservation reuse, Army will seek to transfer the parcel based upon GSA's highest and best use criteria. The Army will work with FWS and GSA to conclude a transfer that is compatible with the neighboring Refuge.

- A. Prior to the Army's transfer of property to a third party, the Army will coordinate with and solicit input from the FWS. The Army will provide in writing to the FWS: (1) the name of proposed third party recipient; (2) the intended use(s) of the parcel; and (3) the Army's rationale for concluding that the proposed use is consistent with FWS's existing or proposed uses of adjacent Refuge parcels as will be identified in any Refuge Management Plan.
- **B.** The FWS will review and comment on the Army's proposed third party transfer. FWS will notify the Army, within 30 days of notice of Army's intent to transfer to a third party, that the proposed use of the parcel is compatible or incompatible with Refuge purposes. If the proposed use is incompatible, FWS will provide an explanation. Compatibility determinations will only include evaluations of how the proposed use would affect the ability of the Refuge to meet its mandated purposes. The Parties may contact the third party prior to rendering a decision to encourage dialog on how the proposed use might be modified to be compatible. If FWS concerns cannot be accommodated and the Army would still like to move forward with the proposed transfer, the Army will initiate Dispute Resolution in accordance with the process established in Section X.
- **C.** To the extent that restrictive covenants or conservation easements are deemed necessary to preserve the Parties' intent with respect to compatibility, the Parties will work cooperatively with GSA to include such restrictive covenants or

easements. Such restrictive covenants or easements will not require the Army to enforce the provisions of the deed or easement.

### V. TRANSFER OF ADMINISTRATIVE JURISDICTION

- A. **Transfer.** Upon the determination by FWS that a Candidate Parcel is suitable for transfer in accordance with Section III, the Army and FWS shall take all necessary actions, in cooperation with GSA, to transfer the parcel to FWS as expeditiously as possible. The Army shall transfer the Candidate Parcel, through GSA, to FWS, without reimbursement, and FWS will accept such Transfer within 90 days. When FWS accepts the Transfer of a Candidate Parcel, it becomes a Transferred Parcel.
- **B. Easements and Agreements.** The Parties agree that transfers of Candidate Parcels to FWS may be subject to certain property rights of third parties, such as easements for public roads, access roads, and utilities. Army will identify and provide documentation for any such easements and leases that currently exist on the property. With respect to Candidate Parcels, the Army shall not amend any existing, or enter into any additional leases, easements, or other real estate agreements, or transfer or convey any interests in such parcels, except with the consent of FWS.
- **C. Mineral Leases.** Nothing in this MOA shall be construed to alter the rights and obligations under existing mineral leases.
- D. Water Rights. All water rights in the Property are presently permitted to the United States based upon the former use of the Property as an ammunition production facility. Nothing in the MOA shall be deemed to abandon the water rights of the United States. The Parties agree that the first property transfer will include the transfer of 75% of the permitted water rights to the FWS. The remaining 25% of the permitted water rights will remain with the Army. On the effective date of this MOA, Army will take all necessary steps to assist and support FWS in complying with the requirements of Texas law by sending a letter agreeing to the processing of a Change of Ownership and Change in Use Application to transfer 75% of the consumptive and non-consumptive appropriated water rights for the Property to the Texas Commission of Environmental Quality, Water Supply Division. The FWS is responsible for all fees required by the State of Texas to process these changes. In addition, in the future and only as necessary, the Parties agree to discuss a potential reallocation of water rights as reuse uncertainties are resolved. The outcome of any reallocation discussion will in no way, as determined by the FWS, adversely affect the current or proposed FWS use of the property as a wildlife refuge.

- **E. Land Surveys.** Surveys for the boundary of the Property have been completed by FWS. If FWS rejects any Candidate Parcels for Transfer in writing as described in Section III, then the Army will provide to FWS survey plats, descriptions, and supporting records only for those Candidate Parcels that the Army will transfer to a third party.
- **F. Information.** The Army shall, as soon as practicable, provide FWS with all information concerning Environmental Contaminants including information related to environmental investigations, documentation, past or proposed Response or restoration actions, or other compliance, closure, operation, maintenance, or related activity associated with LHAAP Candidate Parcels.
- **G. Records.** Prior to Army's disposal of any LHAAP records, Army and FWS shall jointly identify all LHAAP records (e.g., property records, environmental records, historical or cultural resources surveys) that shall be transferred to FWS or otherwise preserved.
- **H.** Equipment and Facilities Retained for FWS. FWS has identified and requested in writing those buildings, facilities, and equipment on the Property that FWS wishes to have transferred.
- I. Access to Army Retained Parcels. Army shall provide to FWS reasonable access to Army-retained parcels for Refuge management purposes.
- J. Withdrawal of Request for Property. The FWS will notify GSA that it is withdrawing its request for property: following a determination by the FWS that the property is not suitable for transfer in accordance with Section III of this MOA; following the identification of a third party transferee in accordance with Section IV of this MOA; or the Parties otherwise agree that the Army cannot obtain cleanup objectives in a timely manner or it is infeasible to transfer the property to the FWS. In addition, if such parcel is part of the Overlay Refuge, FWS and Army shall determine if modification to any existing Memoranda of Agreement described in Section II.A are necessary.

### VI. ENVIRONMENTAL CONTAMINANTS AND FUTURE RESPONSE ACTIONS

A. Federal Facilities Agreement. The Army and FWS acknowledge that the Property is listed as a National Priorities List (NPL) site under the CERCLA. The Army has provided FWS with a copy of the Longhorn Army Ammunition Plant Federal Facility Agreement ("FFA") entered into by the EPA, the Texas Commission on Environmental Quality ("TCEQ"), and the Army on December 30, 1991. FWS acknowledges receipt of this document. The Army agrees to provide FWS with any future proposed amendments to the FFA. Army will consult with FWS concerning such amendments and consider its comments prior to amending the FFA. The environmental remediation of the Property by the Army shall be in accordance with the FFA negotiated with the EPA. The Army and FWS agree that should a conflict arise between the terms of the FFA as it presently exists or as amended and the provisions of this MOA, the terms of the FFA will take precedence over the provisions of this MOA. The Army will inform FWS of any such conflicts affecting the FWS use of its parcel. Both Parties to this MOA are required to provide notice to EPA and TCEQ of any modifications, amendments or termination of the MOA. FWS and its successors and assigns shall take no action inconsistent with the terms of the FFA. FWS will be afforded an opportunity to participate in the Monthly Managers Meeting and the Technical Review Committee.

- B. Continuing Army Responsibility. The Army shall have sole responsibility to fund and to conduct all necessary Response Actions (including Land Use Controls) consistent with this MOA, to address releases or threatened releases of Environmental Contaminants on the Transferred Parcels (including any off-Refuge migration) existing at the time of the effective date of this MOA, whether known at the effective date of this MOA, or subsequently discovered, or from the use, management, storage, release or disposal of Environmental Contaminants by the Army during its occupancy or use of the Transferred Parcels. The Army shall also be responsible for Environmental Contaminants that are in the future regulated as hazardous under federal or state (as defined under CERCLA, 42 U.S.C. 9601(27)) law applicable to the Transferred Parcels and that require a Response Action as a result of a release or threatened release of which the Parties jointly agree (or is determined through dispute resolution) requires a Response Action to protect human health and the environment.
- C. Land Use Controls. LUCs may be required for certain portions of the Transferred Parcels. FWS agrees to comply with LUCs imposed on the property and assist Army by monitoring, maintaining, and enforcing those LUCs that fall within the normal course of refuge management. Following consultation with the Army, FWS will determine what falls within the normal course of refuge management.
- **D. Enforcement Actions and Administrative Indemnification.** To the extent authorized by law and consistent with this MOA, the Army shall be responsible for responding to any administrative or legal actions brought to enforce the requirements of applicable laws or regulations concerning Environmental Contaminants. With respect to the Transferred Parcels, it is the intent of the Parties that any administrative or legal actions necessary to enforce the requirements of applicable laws or regulations concerning Environmental
Contaminants for which the Army has retained responsibility should be taken against the Army, and not against the FWS.

- **E. Safety Training Associated with MEC.** The Army shall provide MEC safety training for FWS personnel. The training shall include recognition of MEC, a map identifying all known locations that may contain MEC, and procedures for reporting suspected MEC. In addition, the Army will provide FWS with MEC safety materials appropriate for distribution to its agents and visitors to the Refuge. FWS will provide MEC safety information to its agents and visitors to the Refuge.
- **F.** Access to Army for Response Actions and Environmental Compliance. FWS shall provide the Army, EPA, and TCEQ and their officers, agents, employees, contractors, and subcontractors with access to the Transferred Parcels as may be reasonably required to carry out the Army's obligations under this MOA and the FFA. The Army shall be responsible for controlling public access to Response Action areas, as appropriate, and providing FWS with reasonable notice regarding access to the areas. The Parties will make reasonable efforts to coordinate access for Response Actions with refuge management activities. In cases of emergency, however, the Army has the right to enter immediately and shall notify FWS as soon as practicable, but no later than 72 hours after entry.
- G. Emergency Response Actions. In the event of an emergency situation or the need to abate imminent and substantial threats to human health or the environment caused by existing or newly discovered Environmental Contaminants, FWS shall provide notice to the Army and take steps to secure the affected area to prevent public access and/or warn the public against entry into the affected area. If Army has not responded within 72 hours of receiving notice, FWS may undertake Response Actions with respect to the Environmental Contaminants.
- H. Roads and Bridges. FWS shall maintain roads and bridges within the Transferred Parcels that are needed by Army for Response Actions or to obtain access to LHAAP Parcels that have not transferred, and that are needed by FWS for refuge activities, to a standard no higher than that needed by FWS for refuge purposes. The Army shall retain maintenance responsibility for roads and bridges within the Transferred Parcels that are needed only by Army for access to Response Actions on Transferred Parcels or to other LHAAP Army-retained parcels. The repair of any damage, other than normal wear and tear, caused by the Army or its contractors to FWS-maintained roads, shall be the responsibility of Army.
- I. Discovery of Additional Environmental Contaminants

- 1. Notice. If FWS discovers additional Environmental Contaminants on the Transferred Parcel, or otherwise identifies previously unidentified conditions associated with such Environmental Contaminants that may require a Response Action, it shall notify Army of such contaminants as soon as reasonably possible after such discovery.
- 2. Army Action Upon Notice. As soon as practicable, but no later than 30 days after the Army receives notice from FWS, or any third party regulatory agency, or other third parties, of the presence or reasonably likely presence of Environmental Contaminants, the Army shall conduct an on-site inspection and provide written notification to FWS of Army's proposed course of action. FWS will, to the maximum extent practicable, give the Army an opportunity to execute any required Response Actions.
- 3. FWS Authority to Respond. The Parties recognize that, under certain circumstances, FWS may decide it is necessary to exercise its authority to undertake Response Actions with respect to Environmental Contaminants. Before doing so, FWS will provide notice to the Army and, to the maximum extent practicable, give the Army an opportunity to execute any required Response Actions. Circumstances in which FWS may exercise its authority to respond may include, but are not limited to: (i) emergency situations; (ii) the need to abate imminent and substantial threats to human health or the environment caused by existing or newly-discovered Environmental Contaminants, (iii) the need to take steps to secure an area to prevent public access or warn the public against entry, or (iv) pursuant to a written agreement between the Parties after on-site inspection of site conditions.
- 4. **Reimbursement.** For Army to pay FWS for response costs associated with Environmental Contaminants under one of the circumstances listed in Sections VI.G or VI.I.3, above, the Army and FWS must agree to such costs in writing and in accordance with applicable law prior to FWS taking any Response Action. Army shall promptly review requests for payment pursuant to such agreement, and upon approval by Army and subject to audit and funding for such purposes, Army will make all reasonable effort to reimburse FWS within 60 days. In case of an emergency in which FWS conducts a Response Action without a prior written agreement with Army, the Army shall seek and use its best efforts to determine the appropriateness of that Response Action undertaken relative to former Army activities on the Property and attempt to obtain the specific appropriations from Congress to reimburse FWS for reasonable and necessary response costs associated with the Response Action by FWS. To the extent FWS violates a LUC that creates a release, FWS will be responsible for any costs associated with the release.

- J. Additional Response Actions. The Army shall conduct additional Response Actions and/or remove or modify LUCs, as determined appropriate through the CERCLA 5 year reviews. The Army shall conduct additional Response Actions, at a minimum, where (1) the remedy fails (e.g., the remedy fails to achieve Response Action objectives or a LUC fails that is not due to the acts or omissions of FWS); (2) a new Environmental Contaminant is discovered that is not addressed by the original Response Action; or (3) changes in laws and regulations governing cleanup standards necessitate additional Response Actions. Any Response Actions required under this paragraph shall be conducted in accordance with the terms of Section VI.I above.
- K. Remedy Reviews. If a Response Action results in Environmental Contaminants remaining on a Transferred Parcel above levels that allow for unrestricted use and unlimited exposure, the Army, in cooperation with FWS, shall review such action no less than every five years after initiation of the Response Action in accordance with the National Contingency Plan (40 C.F.R. Section 300.430(f)(4)(ii)). The review will include an assessment of whether the remedy is functioning as intended, whether the assumptions are still valid, and whether anything has occurred on a Transferred Parcel that calls into question the protectiveness of the remedy. In addition, the review will assess whether LUCs remain protective and continue to be justified in light of changed circumstances or new technology. The results of the reviews shall be documented in the CERCLA Five Year Review Report.
- L. Law Enforcement. FWS shall be responsible for all Federal law enforcement on the Transferred Parcels.
- VII. NOTICES AND POINTS OF CONTACT. All notices required or permitted under this MOA shall be in writing and shall be deemed sufficiently served when delivered by hand, if a receipt is obtained therefore, or when actually received if delivered by mail, and if delivered by mail shall be mailed registered or certified first class mail, return receipt requested, postage pre-paid. All notices shall be sent to:

| A. | Army POC: | Longhorn AAP Site Manager |
|----|-----------|---------------------------|
|    |           | Box 3, B1440              |
|    |           | Fort Chaffee, AR 72905    |

B. FWS POC: USFWS P.O. Box 1306 Albuquerque, NM 87103-1306 Attention: Refuge Supervisor, Texas, NWRS

Or For Delivery: 500 Gold Avenue, S.W. Room 8210 Albuquerque, NM 87102

- VIII. TORT CLAIMS. Army shall process and adjudicate all administrative claims and defend litigation asserted under the Federal Tort Claims Act that arise from any activity of Army with respect to Transferred Parcels, any Environmental Contaminants under this MOA and applicable laws, or out of any failure of Army to comply with applicable laws or the terms and conditions of this MOA. FWS shall process and adjudicate all administrative claims and defend litigation asserted under the Federal Tort Claims Act that are not the responsibility of Army or occur as a result of any failure of FWS to comply with applicable laws or the terms and conditions of this mode. Each Party shall cooperate with the other in providing information relating to any such tort claims.
- **IX. FUNDING.** Unless otherwise agreed, all Parties will be solely responsible for funding their respective responsibilities under this MOA. Nothing in this MOA shall be construed as obligating funds in violation of the Anti-Deficiency Act, 31 U.S.C. 1341.
- X. **DISPUTE RESOLUTION.** If a dispute arises, the Army site manager and the FWS project leader shall make a good faith effort to settle the dispute informally, at the local level. If a dispute arises that cannot be resolved informally at that level, either Party may initiate Dispute Resolution.
  - A. To initiate Dispute Resolution, the disputing Party shall advise the other Party of its intent to invoke Dispute Resolution and give written notice of the dispute. The notice shall include a detailed explanation of the dispute. Upon receipt of such notice the Parties shall make their best efforts to resolve the dispute within 14 calendar days.
  - **B.** If the Parties do not resolve the dispute at the local level within 14 days, the dispute will be elevated to the Director, BRAC, Hampton Field Office and to the Fish and Wildlife Service's Regional Director for the Southwest Region. Within 30 days of receiving the dispute, the Director Hampton Field Office and the Fish and Wildlife Service's Regional Director for the Southwest Region shall confer and attempt to resolve the dispute.
  - **C.** If the dispute is not resolved within 60 days of its receipt, the disputing Party may elevate the dispute to the Assistant Secretary of the Army (Installation and Environment) and the Director of the Fish and Wildlife Service. Within 30 days of the elevation of the dispute, the Parties shall confer and resolve the dispute.

- **XI. RESERVATION OF RIGHTS.** Nothing in this MOA shall limit the rights of either Party to take action against entities not party to this MOA who may be liable for Environmental Contaminants. In addition, nothing in this MOA will prevent or otherwise restrict the right of GSA to dispose of the property, or any portion thereof, in accordance with the applicable real property disposal laws and regulations.
- XII. NO THIRD PARTY RIGHTS. This MOA is intended only to set forth the terms and conditions for the transfer of the Property described herein, and is not intended to create any right, benefit, or trust responsibility, substantive or procedural, enforceable at law by any person against the United States, its agencies, or any other person.
- XIII. EFFECTIVE DATE, MODIFICATION, AND TERMINATION. This MOA shall become effective upon approval by both the Army and FWS. Modifications may be proposed at any time by either Party, and shall become effective pursuant to the terms of such modifications, as agreed to by the Parties. This MOA shall remain in effect until such time as the Parties mutually agree to its termination.

### TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

September 21, 2007

Ms. Rose Zeiler Army / BRAC Site Manager Longhorn Army Ammunition Plant Post Office Box 220 Ratcliff, AR 72951

Re: Longhorn Army Ammunition Plant (LHAAP) Response to Comments for Draft Final Site Investigation Report, LHAAP-06, -51, -55, -64, -66, and -68

Dear Ms. Zeiler:

The Texas Commission on Environmental Quality (TCEQ) has completed review of Army's responses to agency comments to the referenced report, the revised analytical tables and the results of the additional sampling for the above referenced report. We concur that the above referenced sites can be closed under the Texas Risk Reduction Rule Standard 2 (RRR Std 2) for non-residential settings.

Although we concur that no active remediation is necessary at these sites, please note that under RRR Standard 2, site closure/remediation, in order to comply with the non-residential soil requirements, a deed certification must be filed in the county record. The deed certification must indicate that future land use is considered suitable for non-residential use. An example format of the deed certification is provided in 30 Texas Administrative Code §335.569.

If you have any questions or need additional information, please feel free to contact me at (512) 239-2443.

Sincerely

Fay Duke, Project Manager Team 2, Environmental Cleanup Section II Remediation Division

## **TEXAS COMMISSION ON ENVIRONMENTAL QUALITY**

Protecting Texas by Reducing and Preventing Pollution

September 24, 2007

Ms. Rose Zeiler Army / BRAC Site Manager Longhorn Army Ammunition Plant Post Office Box 220 Ratcliff, AR 72951

### Re: Longhorn Army Ammunition Plant (LHAAP) Draft Final Data Evaluation Report, Chemical Concentration in Soil Samples Associated with LHAAP-35/36 Sumps

Dear Ms. Zeiler:

The Texas Commission on Environmental Quality (TCEQ) has completed review of Draft Final Data Evaluation Report (Shaw Environmental, Inc. August 2007). This report presents an evaluation of chemical concentrations in soil samples associated with the 126 wastewater sumps and 20 waste rack sumps, known collectively as site LHAAP 35/36 at the Longhorn Army Ammunition Plant Superfund Site.

These sumps were previously investigated by the U.S. Army Corps of Engineers and Army contractors and subsequently closed. The closures of most of the sumps have been approved by TCEQ. However, it was determined additional evaluations of the soil around the former sumps were required. Although various soil data associated with each of the sumps have previously been collected for the 2002 and 2003 baseline risk assessment reports for the majority of the sump sites, it was determined that additional soil data around the sumps were necessary to complete the evaluation of the risk posed by soil around these sumps. The report summarizes the results of the additional data collection and risk evaluation to determine whether the additional data would change the conclusions of the previous risk assessments. Our comments/approval are provided below.

Soil samples collected adjacent to sumps associated with sites LHAAP-04, -29, -39 and -66 have concentrations below the TCEQ Risk Base Screening Values (RSBVs). Therefore, we concur that no active remediation would be required for soil around these sumps for the protection of human exposure to on-site soil. However, we note that additional evaluation may be necessary to ensure concentrations in soil would not serve as a continuous source of contamination to groundwater and surface water.

Previous risk assessment indicated acceptable risk to an industrial worker from exposure to chemicals in soil from sites LHAAP-18/24, -35(58), -46, and -47. For soil samples collected adjacent to sumps associated with sites LHAAP-18/24, -35A(58), -46, and -47 that have concentrations above the RBSVs, exposure point concentrations for chemicals which exceeded the RBSV were developed. The evaluation of the exposure point concentration values developed using the sampling results subsequent to the 2003 risk assessment indicates that the additional data contributes negligible increases to the cancer risk and noncancer hazard values of the previous risk assessment with resulting risk values still in the acceptable range. Therefore, we concur that no active remediation would be required for soil around these sumps for

Ms. Rosen Zeiler Page 2

the protection of human exposure to on-site soil at LHAAP-, 18/24, 35A(58), -46 and -47. However, we note that additional evaluations are necessary to ensure concentrations in soil would not serve as a continuous source of contamination to groundwater and surface water. This is especially imperative in the area surrounding Building 25C where perchlorate contamination was observed to have migrated into the surface water. We understand a cover was placed in areas adjacent to Bulding 25C as a temporary abatement. We believe that a permanent remedy should be evaluated to ensure that contaminated soil would not impact the surface water.

Additionally, please note that under the Risk Reduction Rule, site closure/remediation, in order to comply with the non-residential soil requirements, a deed certification must be filed in the county record. The deed certification must indicate that future land use is considered suitable for non-residential use. An example format of the deed certification is provided in 30 Texas Administrative Code §335.569.

Finally, we note that many soil samples analyzed for semivolatiles (SVOCs) were diluted and yet no SVOC compounds were detected. The dilution of samples resulted in an elevation of sample quantitation limits that exceeded the RBSVs. Please provide the rationale for the need to dilute these samples.

If you have any questions or need additional information, please feel free to contact me at (512) 239-2443.

Sincerely

alle

Rose,

Enclosed please find the TCEQ comments on the Draft Final Data Evaluation Report, Chemical Concentration in Soil Samples Associated with LHAAP-35/36 Sumps.

Additionally, I had an editorial comment that I did not include in the letter. On page 4-21, Section 4.4.31, the last sentence should read " The evaluation of mercury manganese is described in Section 4.5."

Please let me know if you should have any questions or concerns.

# FINAL

# PROPOSED PLAN FOR LHAAP-08 FORMER SEWAGE TREATMENT PLANT

## **ISSUED BY: U.S. ARMY**

Longhorn Army Ammunition Plant Karnack, Texas

January 2008

### THE U.S ARMY ANNOUNCES PROPOSED PLAN FOR LHAAP-08

In this Proposed Plan the U.S. Army presents its proposal for no action at LHAAP-08, the former sewage treatment plant at Longhorn Army Ammunition Plant (LHAAP). The purpose of the Proposed Plan is to facilitate public involvement in the remedy selection process. The Proposed Plan provides the public with basic background information about LHAAP-08, recommends that no action is necessary to ensure the protection of human health and the environment, and explains the rationale for recommending no action.

The U.S. Army is issuing this Proposed Plan for public review, comment, and participation to fulfill part of its public participation responsibilities under Sections 117(a), 113(k)(2)(B), and 121(f)(1)(G) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 as amended by the Superfund Amendments and Reauthorization Act of 1986, and under Section 300.430(f)(2) of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). This Proposed Plan summarizes information that can be found in greater detail in the Remedial Investigation (RI) Report Addendum, the Baseline Human Health and Screening Ecological Risk Assessment, the Installation-Wide Baseline Ecological Risk Assessment, and other supporting documents that are contained in the Administrative Record for LHAAP-08. The project management team, including the U.S. Army, U.S. **Environmental Protection Agency** (USEPA), and the Texas Commission on Environmental Quality (TCEQ), encourages the public to review these

#### Dates to remember: MARK YOUR CALENDER

#### **PUBLIC COMMENT PERIOD:**

January 13, 2008 to February 14, 2008 The U.S. Army will accept written comments on the Proposed Plan during the public comment period.

**PUBLIC MEETING:** The U.S. Army will hold a public meeting to explain the Proposed Plan for LHAAP-08. Oral and written comments will be accepted at the meeting. The meeting will be held on January 29, 2008 from 6:30 p.m. to 8:30 p.m. at Karnack Community Center.

For more information, see the Administrative Record at the following location:

Marshall Public Library, 300 S. Alamo Marshall, Texas 75670 Business Hours: Monday – Thursday (10:00 a.m. – 8:00 p.m.) Friday – Saturday (10:00 a.m. – 5:00 p.m.)

For further information on LHAAP-08, please contact: Dr. Rose M. Zeiler Site Manager Longhorn Army Ammunition Plant P.O. Box 220 Ratcliff, Arkansas, 72951 Phone No.: 903.679.3192 Direct No.: 479.635.0110 E-mail address: rose.zeiler@us.army.mil

documents to gain a more comprehensive understanding of the environmental conditions at LHAAP-08, and also to review and comment on the recommendation for no action presented in this Proposed Plan.

The U.S. Army, the lead agency for environmental response actions at LHAAP, is acting in partnership with USEPA Region 6 and TCEQ. As the lead agency, the U.S. Army is charged with planning and implementing remedial actions at LHAAP. Regulatory agencies assist the U.S. Army by providing technical support, project review, project comment, and oversight in accordance with the Federal Superfund law and the existing Federal Facilities Agreement.

### SITE BACKGROUND

LHAAP is located in central-east Texas in the northeastern corner of Harrison County (**Figure 1**). The installation originally occupied nearly 8,500 acres between State Highway 43 at Karnack, Texas, and the western shore of Caddo Lake. The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the southeast.

Caddo Lake, a large freshwater lake situated on the Texas-Louisiana border and a drinking water source for multiple communities, bounds LHAAP to the north and east.

The U.S. Army has transferred approximately 7,000 acres at LHAAP to the U.S. Fish and Wildlife Service (USFWS) for management as The Caddo Lake National Wildlife Refuge. The property transfer process is continuing as response is completed at individual sites.

Due to releases of chemicals from operation and maintenance activities at the facility, LHAAP was placed on the Superfund National Priorities List (NPL) on August 9, 1990. Activities to remediate contamination associated with the listing of LHAAP as a Superfund site began in 1990. After being listed on the NPL, the U.S. Army, the USEPA, and the Texas Water Commission (currently known as the TCEQ) entered into a **CERCLA Section 120 Federal Facility** Agreement (FFA) for remedial activities at LHAAP. The FFA became effective December 30, 1991. LHAAP operated until 1997 when it was placed on inactive status and classified by the U.S. Army

Armament, Munitions, and Chemical Command as excess property.

Figure 1 Location of the Longhorn Army Ammunition Plant Harrison County, Texas

### LHAAP-08

LHAAP-08 was the sewage treatment plant that operated from 1942 to 1997. LHAAP-08 is located in the central portion of LHAAP and covers an area of approximately 1 acre. The plant was modified over time to handle hydraulic capacity of 0.5 million gallons per day. The sewage treatment plant received domestic wastewater through 6-inch and 15-inch pipelines. The plant also received storm water, boiler blow down, laundry waste, vehicle wash rack waste, and effluent from film development at the Xray facility. The sewage treatment plant was not used to treat water from trinitrotoluene (TNT) manufacturing facilities. The plant discharged treated effluent into Goose Prairie Creek and

Caddo Lake (Jacobs Engineering Group, 2002).

The sewage treatment plant included stabilization ponds, Dunbar filters, sludge drying beds, and an Imhoff tank. The stabilization ponds received brine consisting of saltwater backwash from softeners and filters used to condition the water before it was sent to boilers. Dunbar filters were originally used in treatment of domestic sewage mixed with wastewater from the X-ray film development laboratory. Sludge drying beds received sludge generated in a grit chamber and aerobic digester. An Imhoff tank, considered the primary treatment of wastewater, consisted of two chambers that allowed suspended solids to drop out and pass through a slot from the upper chamber into the lower chamber. Anaerobic digestion occurred in the lower chamber.

### SITE CHARACTERISTICS

LHAAP-08 is located in the northern area of LHAAP (Figure 2). The site is located in the Goose Prairie Creek drainage system, which drains approximately 30 percent of the installation. Shallow groundwater in the vicinity of LHAAP flows to the east toward Harrison Bayou.

In December 2000, soil and groundwater samples were collected from LHAAP-08. Two groundwater monitoring wells were installed at 18 and 19 feet below ground surface (bgs). Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), explosive compounds, metals, perchlorate, dioxin/furan compounds, pesticides, and polychlorinated biphenyls (PCBs).

No measurable concentrations of SVOCs, explosive compounds, pesticides, or PCBs were detected in any soil sample. One VOC, methylene chloride, was detected in one soil sample at a low concentration near its detection limit. Lead, mercury, and silver were detected with concentrations evenly distributed among the samples in soil, with the exception of one elevated silver concentration measured in soil located near the Dunbar filters, which processed waste from the Xray film development laboratory. This concentration was confined to within 3 to 5 feet of the sampling location. Two dioxin compounds (octachlorodibenzo-pdioxin and hexachlorodibenzo-p-dioxin) were detected at low concentrations in seven of the eight soil samples analyzed.

Four soil samples were collected in June 2000 for perchlorate analysis only. One of the samples taken from the 1 to 2 foot interval contained detectable perchlorate at a concentration of 32 micrograms per kilogram ( $\mu$ g/kg).

No detectable concentrations of SVOCs, explosive compounds, perchlorate, pesticides, or PCBs were detected in the groundwater samples. Acetone, a common laboratory contaminant was the only VOC with a detectable groundwater concentration. Fourteen metals were detected in groundwater samples at low concentrations. Eight dibenzodioxin or dibenzofuran compounds were detected at low levels, with octachlorodibenzo-pdioxin the most widespread.

A human health risk assessment was conducted in 2003, which indicated no unacceptable cancer risk or noncancer hazard to a trespasser or a maintenance worker from exposure to the above chemicals detected in soil or groundwater (Jacobs Engineering Group, 2003).

### SUMMARY OF SITE RISKS

The most reasonably anticipated future use of this site is industrial/recreational as a national wildlife refuge. This anticipated future use is based on a Memorandum of Agreement (U.S. Army, 2004) between the USFWS and the U.S. Army in which is documented the transfer process of the Longhorn Army Ammunition Plant acreage to USFWS to become the Caddo Lake National Wildlife Refuge. Presently the Caddo Lake National Wildlife Refuge occupies over 7,000 acres of the former installation. The property must be kept as a national wildlife refuge unless there is an act of Congress that removes the parcel, or the land is exchanged in accordance with the National Wildlife Refuge System Administration Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974.

### Human Health Risks

The baseline human health risk assessment was conducted for LHAAP-08 to determine current and future effects of contaminants on human health and to support technical review and risk management decisions (Jacobs Engineering Group, 2003).

The NCP, 40 Code of Federal Regulations Part 300, establishes a range of acceptable levels of cancer risk for Superfund sites between one in 10,000 and one in 1 million additional cancer cases if cleanup action is not taken at a site. Expressed in scientific notation, this translates to an acceptable risk range of  $1 \times 10^{-4}$  to  $1 \times 10^{-6}$ over a defined period of exposure to site related contaminants.

In addition to a cancer risk, chemical contaminants that are ingested, inhaled, or

dermally absorbed may present noncancer hazards to different organs of the human body. The non-cancer hazard or toxic effect is expressed as a Hazard Index (HI). EPA considers an HI exceeding 1.0 to be an unacceptable non-cancer hazard.

During the risk assessment, cancer risk and the non-cancer HI were calculated for a current trespasser scenario and a future industrial maintenance worker scenario. In these scenarios, exposure to the site environmental media was evaluated (e.g., soil and groundwater) (Jacobs Engineering Group, 2003). The baseline human health risk assessment calculated the HI for exposure to soil to be 0.005 for the current trespasser, and 0.24 for the future maintenance worker. The cancer risk for soil was  $1.4 \times 10^{-8}$  and  $1.7 \times 10^{-7}$ for the trespasser and maintenance worker, respectively. Both the HI and cancer risk are acceptable for exposure to chemicals in soil by both current trespassers and future maintenance workers.

Both the non-cancer HI and cancer risk were acceptable for groundwater. The HI estimated for future maintenance worker exposure to groundwater by drinking or showering was 0.21 and the cancer risk was  $7.3 \times 10^{-5}$ . All risk above  $1 \times 10^{-6}$  is due to dioxin and furan congeners, which are reported as an equivalent (2,3,7,8tetrachloradibenzo-p-dioxin [TCDD]) concentration (Jacobs Engineering Group, 2003). Although risk is within the acceptable  $1 \times 10^{-6}$  to  $1 \times 10^{-4}$  range, the estimate was considered to be elevated due to the use of undetected dioxin congener concentrations in the calculations. All congeners analyzed were reported either as not detected or as estimated values having concentrations above their detection limit but below the reporting limit (J-qualified) values.

Risk assessment calculations for dioxin/furan congeners involve the toxicity equivalent factors (TEFs) provided in TCEQ guidance, which are used to convert the detected congeners to a relative 2,3,7,8-TCDD concentration, termed the 2,3,7,8-TCDD toxicity equivalent (TEQ) concentration.

The calculations used in the Jacobs Engineering Group (2003) risk assessment were repeated using only the J-qualified congener concentrations. The resulting 2,3,7,8-TCDD TEQ concentration was 0.01 nanograms per liter (ng/L), which is below the MCL for 2,3,7,8-TCDD TEQ of 0.03 ng/L.

The assessment of risk to current trespassers and future industrial maintenance workers from exposure to chemicals in soil and groundwater at LHAAP-08 indicated that potential human health risks are within the acceptable range established by the USEPA. Therefore, no action is necessary at LHAAP-08.

Limited monitoring in the form of Five-Year Reviews is required because this site has not been evaluated for unrestricted use. The risk evaluation, which was based on the reasonably anticipated future use as a wildlife refuge, does not address unrestricted use. The Five-Year Reviews will serve to document that the use of the site is consistent with the industrial/recreational exposure scenario evaluated in the risk assessment.

### Ecological Risk

The ecological risk for the site LHAAP-08 was addressed in the installation-wide Baseline Ecological Risk Assessment (BERA) (Shaw, 2007). For the BERA, the entire installation was divided into three large sub-areas (i.e., the Industrial Sub-Area, Waste Sub-Area, and Low Impact Sub-Area) for the terrestrial evaluation. The individual sites at LHAAP were grouped into one of these sub-areas, which were delineated based on commonalities of historic use, habitat type, and spatial proximity to each other. The conclusions regarding the potential for chemicals detected at individual sites to adversely affect the environment must be made in the context of the overall conclusions of the sub-area in which the site falls. Site LHAAP-08 lies within the Industrial Sub-Area.

The BERA concluded that no unacceptable risk was present in the Industrial Sub-Area (Shaw, 2007) and therefore, no further action is needed at LHAAP-08 for the protection of ecological receptors.

The land on which LHAAP-08 is located is excess to the Army's needs and is intended for transfer to the USFWS for incorporation into the Caddo Lake National Wildlife Refuge. Future anticipated use is consistent with an industrial/recreational level of exposure.

### RECOMMENDATION

No action is proposed for this site. This recommendation is based on the existing data and determination of no unacceptable risk to human health. A Record of Decision based on this recommendation will allow this site to be removed from the list of LHAAP environmental sites requiring additional effort by the U.S. Army. The recommendation for no action is consistent with the criteria required under CERCLA.

Notification of industrial/recreational use will accompany all transfer documents and will be recorded in the County Courthouse. Five-Year Reviews will be performed to document that the land use remains consistent with the industrial/recreational exposure scenario evaluated in the risk assessment.

### **COMMUNITY PARTICIPATION**

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-08 through public meetings, the Administrative Record file for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. The public is encouraged to gain a more comprehensive understanding of the site.

The dates for the public comment period, the date, location, and time of the public meeting, and the locations of the Administrative Record files are provided on the front page of this Proposed Plan.

Any significant changes to the Proposed Plan, as presented in this document, will be identified and explained in the Record of Decision.

#### GLOSSARY OF TERMS

Administrative Record — The body of reports, official correspondence, and other documents that establish the official record of the analysis, cleanup, and final closure of a CERCLA site.

**Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)** — This law authorizes the Federal Government to respond directly to releases (or threatened releases) of hazardous substances that may be a danger to public health, welfare, or the environment. The U.S. Army currently has the lead responsibility for these activities.

**Environmental Media** — A major environmental category that surrounds or contacts humans, animals, plants, and other organisms (e.g., surface water, ground water, soil, or air) and through which chemicals or pollutants move.

**Exposure** — Contact of an organism with a chemical or physical agent. Exposure is quantified as the amount of the agent available at the exchange boundaries of the organism (e.g., skin, lung, digestive tract, etc.) and available for absorption.

**Groundwater** — Underground water that fills pores in soil or openings in rocks to the point of saturation.

**Remedial Action** — The actual construction or implementation phase of a Superfund site cleanup that follows remedial design.

**Superfund** — The common name used for CERCLA; also referred to as the Trust Fund. The Superfund Program was established to help fund cleanup of hazardous waste sites. It also allows legal action to force those responsible for sites to clean them up.

## **FINAL**

# PROPOSED PLAN FOR LHAAP-32, FORMER TNT WASTE DISPOSAL PLANT

## **ISSUED BY: U.S. ARMY**

# Longhorn Army Ammunition Plant Karnack, Texas

January 2008

### THE U.S ARMY ANNOUNCES PROPOSED PLAN FOR LHAAP-32

In this Proposed Plan the U.S. Army presents its proposal for no action at LHAAP-32, a former trinitrotoluene (TNT) waste disposal plant at Longhorn Army Ammunition Plant (LHAAP). The primary purpose of the Proposed Plan is to facilitate public involvement in the remedy selection process. The Proposed Plan will provide the public with basic background information about LHAAP-32, recommend that no action is necessary to ensure the protection of human health and the environment and explain the rationale for recommending no action.

The U.S. Army is issuing this Proposed Plan for public review, comment, and participation to fulfill part of its public participation responsibilities under Section 117(a), 113(k)(2)(B), and 121(f)(1)(G) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 as amended by the Superfund Amendments and Reauthorization Act of 1986, and under Section 300.430(f)(2) of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). This Proposed Plan summarizes information that can be found in greater detail in the Remedial Investigation Report, the Data Gaps Investigation Report, Final Site Evaluation Report, Installation-Wide Baseline Environmental Risk Assessment, and other supporting documents that are contained in the Administrative Record for LHAAP-32. The project management team, including the U.S. Army, U.S. **Environmental Protection Agency** (USEPA), and the Texas Commission on Environmental Quality (TCEQ), encourages the public to review these documents to gain a more comprehensive understanding of the environmental

#### Dates to remember: MARK YOUR CALENDER

#### **PUBLIC COMMENT PERIOD:**

January 13, 2008 to February 14, 2008 The U.S. Army will accept written comments on the Proposed Plan during the public comment period.

**PUBLIC MEETING:** The U.S. Army will hold a public meeting to explain the Proposed Plan for LHAAP-32. Oral and written comments will be accepted at the meeting. The meeting will be held on January 29, 2008 from 6:30 p.m. to 8:30 p.m. at Karnack Community Center.

For more information, see the Administrative Record at the following location:

Marshall Public Library 300 S. Alamo Marshall, Texas 75670 Business Hours: Monday – Thursday (10:00 a.m. – 8:00 p.m.) Friday – Saturday (10:00 a.m. – 5:00 p.m.)

#### For further information on LHAAP-32, please contact: Dr. Rose M. Zeiler Site Manager Longhorn Army Ammunition Plant P.O. Box 220 Ratcliff, Arkansas, 72951 Phone No.: 903.679.3192 Direct No.: 479.635.0110 E-mail address: rose.zeiler@us.army.mil

conditions at LHAAP-32, and also to review and comment on the recommendation for no action presented in this Proposed Plan.

The U.S. Army, the lead agency for environmental response actions at LHAAP, is acting in partnership with USEPA Region 6 and TCEQ. As the lead agency, the U.S. Army is charged with planning and implementing remedial actions at LHAAP. Regulatory agencies assist the U.S. Army by providing technical support, project review, project comment, and oversight in accordance with the Federal Superfund law and the existing Federal Facilities Agreement.

### SITE BACKGROUND

LHAAP is located in central-east Texas in the northeastern corner of Harrison County (**Figure 1**). The installation originally occupied nearly 8,500 acres between State Highway 43 at Karnack, Texas, and the western shore of Caddo Lake. The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the southeast.

Caddo Lake, a large freshwater lake situated on the Texas-Louisiana border and a drinking water source for multiple communities, bounds LHAAP to the north and east.

The U.S Army has transferred approximately 7,000 acres to the U.S. Fish and Wildlife Service (USFWS) for management as The Caddo Lake National Wildlife Refuge. The property transfer process is continuing as response is completed at individual sites.

Due to releases of chemicals from operation and maintenance activities at the facility, LHAAP was placed on the Superfund National Priorities List (NPL) on August 9, 1990. Activities to remediate contamination associated with the listing of LHAAP as a Superfund site began in 1990. After being listed on the NPL, the U.S. Army, the USEPA, and the Texas Water Commission (currently known as the TCEQ) entered into a **CERCLA Section 120 Federal Facility** Agreement (FFA) for remedial activities at LHAAP. The FFA became effective December 30, 1991. LHAAP operated until 1997 when it was placed on inactive status and classified by the U.S. Army Armament, Munitions, and Chemical Command as excess property.

Figure 1 Location of the Longhorn Army Ammunition Plant Harrison County, Texas

### LHAAP-32

LHAAP-32 was the TNT Waste Disposal Plant that operated from 1942 to 1945. The plant treated wastewater generated at the nearby TNT Production Area (LHAAP-29). The wastewater was transferred to the disposal area through a 6-inch wooden pipeline and stored in holding tanks until treated. Wastewater was neutralized with sodium hydroxide and evaporated. Condensate was collected, stored, and released via the "blue water" ditch to Goose Prairie Creek. The thickened and neutralized wastes were stored until burned at the Incinerator Facility located within LHAAP-32. The remaining ashes were disposed at the Old Landfill (LHAAP-16) until early 1944, when an ash sluicing system was added to the LHAAP-32 treatment plant to dispose of the solids. The resultant solids were conveyed by a ditch to Goose Prairie Creek. This "blue water" ditch also

carried acidic cooling water from the disposal plant to the Neutralizing Plant next to the Bulk Toluene Storage Area in LHAAP-29.

### SITE CHARACTERISTICS

Between 1982 and 2005 several investigations were conducted in a phased approach to determine the nature and extent of contamination at LHAAP-32 (**Figure 2**). Media investigated included soil, groundwater, surface water, and sediment.

Results of the initial investigations indicated elevated levels of metals at one soil sampling location and high levels of explosive constituents in the upper 0.5 feet of soil at another sampling location. No significant contamination was detected in sediment or surface water.

A human health risk assessment was conducted in 2002, which indicated unacceptable risk to a maintenance worker primarily from a high concentration of TNT detected in the former settling pond (Jacobs Engineering Group, Inc. [Jacobs], 2002). Because the unacceptable risk was caused by a single high detection of TNT, it was decided to resample that location and the area around it to confirm the previous results.

In 2004, additional sampling of soil was conducted within the former settling pond where a high level of TNT was previously detected, to replicate and delineate the high TNT concentration (Shaw Environmental, Inc. [Shaw], 2005a). Soil samples were also collected from the former treatment facility building to determine if a release occurred in the past. In addition, groundwater samples were collected from three monitoring wells at the site.

The high detection of TNT in the soil was not replicated during the 2004 re-

sampling. Results of the investigations indicated that only one soil sample located within the former settling pond had a significant detection of TNT; however, the TNT concentration was three orders of magnitude lower than previously detected in the area. One subsurface soil sample collected from the northeastern corner of the former treatment building showed a significant detection of lead. Migration of the soil contaminants at these isolated locations would be impeded due to the lithology of the soil, which consists of stiff clay at the site.

Initial groundwater sampling results indicated that antimony, arsenic, and lead were detected above maximum contaminant levels (MCLs) in groundwater. These chemicals are not related to past operations at LHAAP-32. Instead, they were suspected to be related to the turbidity of the groundwater samples. In order to determine whether or not the chemicals were related to sample turbidity, Shaw re-sampled the wells using low-flow methods. Re-sampling results confirmed that elevated metal levels were associated with high turbidity and not representative of groundwater conditions at the site. No explosives were detected in any of the groundwater samples.

### SUMMARY OF SITE RISKS

The most reasonably anticipated future use of this site is industrial/recreational as a national wildlife refuge. This anticipated future use is based on a Memorandum of Agreement (U.S. Army, 2004) between the USFWS and the U.S. Army in which is documented the transfer process of the LHAAP acreage to the USFWS to become the Caddo Lake National Wildlife Refuge. Presently the Caddo Lake National Wildlife Refuge occupies over 7,000 acres of the former

installation. The property must be kept as a national wildlife refuge unless there is an act of Congress that removes the parcel, or the land is exchanged in accordance with the National Wildlife Refuge System Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974.

### Human Health Risks

The baseline human health risk assessment was conducted for LHAAP-32 to determine current and future effects of contaminants on human health and to support technical review and risk management decisions.

The NCP, 40 Code of Federal Regulations Part 300, establishes a range of acceptable levels of cancer risk for Superfund sites that range between one in 10,000 and one in 1 million additional cancer cases if cleanup action is not taken at a site. Expressed in scientific notation, this translates to an acceptable risk range of  $1 \times 10^{-4}$  to  $1 \times 10^{-6}$  over a defined period of exposure to site related contaminants.

In addition to a cancer risk, chemical contaminants that are ingested, inhaled, or dermally absorbed may present noncancer hazards to different organs of the human body. The non-cancer hazard or toxic effect is expressed as hazard index (HI). USEPA considers an HI exceeding 1.0 to be an unacceptable non-cancer hazard.

During the risk assessment conducted by Jacobs (Jacobs 2002), cancer risk and the non-cancer HI were calculated for a current trespasser scenario and a future industrial worker scenario. The trespasser was assumed to encounter surface soil only (0 to 0.5 feet below ground surface [bgs]). The industrial maintenance worker was assumed to encounter both surface soil and subsurface soil (0 to 2 feet below ground surface [bgs]). The baseline human health risk assessment calculated the HI for the soil to be 35 for the current trespasser, and 230 for the future maintenance worker. The cancer risk for the soil was  $9.2 \times 10^{-5}$  and  $1.2 \times 10^{-3}$  for the trespasser and maintenance worker, respectively. Both the HI and cancer risk were unacceptable for the future maintenance worker, due to the one high detection of TNT. Noncancer hazard and cancer risk were acceptable for groundwater (Jacobs, 2002).

After the soil sampling effort of 2004-2005, Shaw conducted a human health risk evaluation for a future residential receptor's exposure to soil (Shaw, 2005b). The residential baseline human health risk assessment was conducted using data reported in the baseline human health risk assessment for industrial use (Jacobs. 2002) and supplemented by data from more recent additional sampling events by Shaw (2005a). The recent soil sampling did not replicate the extraordinarily high TNT concentration from the one location collected during the previous sampling effort, and all samples from the additional borings had very low or non-detected concentration of TNT. It was therefore determined that elevated concentrations of TNT either do not exist or are so highly localized that they are unlikely to be encountered by humans. Therefore, the LHAAP stakeholders determined that TNT data from the one location with a high TNT level should be eliminated from the risk assessment. The analytical data for the additional samples (Shaw, 2005a) were included in the residential risk assessment (Shaw, 2005b) because it was considered representative of that location. The hypothetical future resident was assumed to encounter both surface and subsurface soil (0 to 15 feet bgs). The estimated cancer risk for soil exposure for

the hypothetical future resident is  $2 \times 10^{-5}$ and the noncancer HI is 0.3; both values are within the acceptable risk range established by USEPA.

Lead is unique among chemicals of concern at LHAAP-32 in that the USEPA does not evaluate lead toxicity using the non-cancer hazard approach. The USEPA specifies a computer model to estimate the level of lead in blood of children through the first seven years of age. If the estimated blood level exceeds a cutoff level (10 micrograms per deciliter  $\left[ \mu g/dL \right]$ ) in more than 5 percent of the population, the USEPA identifies lead as a chemical of concern. The computer model was applied to the lead concentrations in both soil and groundwater at LHAAP-32 and the results estimated a blood concentration of 2.5  $\mu g/dL$  in less than 0.2 percent of the population, indicating that lead is not a chemical of concern for residential use of the LHAAP-32 site.

Antimony, arsenic, and lead, were detected in groundwater above MCLs during previous sampling events. The residential risk assessment for LHAAP-32 indicated that the shallow groundwater does not meet Safe Drinking Water Act requirements and would not be acceptable for residential use. However, the assessment was affected by uncertainties associated with the collection and analysis of groundwater samples. Because previous groundwater samples were not collected using low-flow purging methods, it is probable that the samples contain metals adsorbed to suspended particles or in colloidal form. Such suspended forms would tend to cause an overestimate of the concentration of dissolved chemicals and exceed the MCL values. Re-sampling of groundwater utilizing the low flow method to reduce turbidity effects indicated that elevated
metal levels were associated with high turbidity and not representative of the groundwater at the site.

Thus, no further action is recommended for this site.

#### Ecological Risk

The ecological risk for the site LHAAP-32 was addressed in the installation-wide **Baseline Ecological Risk Assessment** (BERA) (Shaw, 2007). For the BERA, the entire installation was divided into three large sub-areas (i.e., the Industrial Sub-Area, Waste Sub-Area, and Low Impact Sub-Area) for the terrestrial evaluation. The individual sites at LHAAP were grouped into one of these sub-areas, which were delineated based on commonalities of historic use, habitat type, and spatial proximity to each other. The conclusions regarding the potential for chemicals detected at individual sites to adversely affect the environment must be made in the context of the overall conclusions of the sub-area in which the site falls. Site LHAAP-32 lies within the Industrial Sub-Area.

The BERA concluded that no unacceptable risk was present in the Industrial Sub-Area (Shaw, 2007) and therefore, no further action is needed at LHAAP-32 for the protection of ecological receptors.

The land on which LHAAP-32 is located is excess to the Army's needs and is intended for transfer to USFWS for incorporation into the Caddo Lake National Wildlife Refuge. Future anticipated use is consistent with a residential/recreational level of exposure.

#### RECOMMENDATION

No action is proposed for this site. This recommendation is based on the existing data and determination of no unacceptable risk to human health. A Record of Decision (ROD) based on this recommendation will allow this site to be removed from the list of LHAAP environmental sites requiring additional effort by the U.S. Army. The recommendation for no action is consistent with the criteria required under CERCLA.

#### **COMMUNITY PARTICIPATION**

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-32 through public meetings, the Administrative Record file for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. The public is encouraged to gain a more comprehensive understanding of the site.

The dates for the public comment period, the date, location, and time of the public meeting, and the locations of the Administrative Record files are provided on the front page of this Proposed Plan.

Any significant changes to the Proposed Plan, as presented in this document, will be identified and explained in the ROD.

#### GLOSSARY OF TERMS

Administrative Record — The body of reports, official correspondence, and other documents that establish the official record of the analysis, cleanup, and final closure of a CERCLA site.

**Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)** — This law authorizes the Federal Government to respond directly to releases (or threatened releases) of hazardous substances that may be a danger to public health, welfare, or the environment. The U.S. Army currently has the lead responsibility for these activities.

**Environmental Media** — A major environmental category that surrounds or contacts humans, animals, plants, and other organisms (e.g., surface water, ground water, soil or air) and through which chemicals or pollutants move.

**Exposure** — Contact of an organism with a chemical or physical agent. Exposure is quantified as the amount of the agent available at the exchange boundaries of the organism (e.g., skin, lung, digestive tract, etc.) and available for absorption.

**Groundwater** — Underground water that fills pores in soil or openings in rocks to the point of saturation.

**Remedial Action** — The actual construction or implementation phase of a Superfund site cleanup that follows remedial design.

**Superfund** — The common name used for CERCLA; also referred to as the Trust Fund. The Superfund Program was established to help fund cleanup of hazardous waste sites. It also allows legal action to force those responsible for sites to clean them up.

## **USE THIS SPACE TO WRITE YOUR COMMENTS**

Your input on the Proposed Plan for the LHAAP-32 is important to the U.S. Army. Comments provided by the public are valuable in helping the U.S. Army select a final remedy for the site.

You may use the space below to write your comments, then fold and mail to Dr. Rose M. Zeiler, P. O. Box 220, Ratcliff, Arkansas 72951. Comments must be postmarked by February 14, 2008. If you have questions about the comment period, please contact Dr. Rose M. Zeiler at 903.679.3192 or directly at 479.635.0110. Those with electronic communications capabilities may submit their comments to the U.S. Army via Internet at the following e-mail address: rose.zeiler@us.army.mil

# **FINAL**

# PROPOSED PLAN FOR LHAAP-48 (Y-AREA) AND LHAAP-35C (53) (STATIC TEST AREA)

# **ISSUED BY: U.S. ARMY**

Longhorn Army Ammunition Plant Karnack, Texas

January 2008

#### THE U.S ARMY ANNOUNCES PROPOSED PLAN FOR LHAAP-48 AND LHAAP-35C (53)

In this Proposed Plan the U.S. Army presents its proposal for no action at LHAAP-48, formerly known as the Y-Area, and LHAAP-35C (53), a former static test area at Longhorn Army Ammunition Plant (LHAAP). The primary purpose of the Proposed Plan is to facilitate public involvement in the remedy selection process. The Proposed Plan will provide the public with basic background information about LHAAP-48 and LHAAP-35C (53), recommend that no action is necessary to ensure the protection of human health and the environment, and explain the rationale for recommending no action.

The U.S. Army is issuing this Proposed Plan for public review, comment, and participation to fulfill part of its public participation responsibilities under Sections 117(a), 113(k)(2)(B), and 121(f)(1)(G) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 as amended by the Superfund Amendments and Reauthorization Act of 1986, and Section 300.430(f)(2) of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). This Proposed Plan summarizes information that can be found in greater detail in the Remedial **Investigation Report (Jacobs Engineering** Group [Jacobs], 2002), Data Gaps Investigation Report (Shaw Environmental, Inc. [Shaw], 2007a), Site Evaluation Report (Shaw, 2007b), the Installation-Wide Baseline Ecological Risk Assessment (Shaw, 2007c), and other supporting documents that are contained in the Administrative Record for LHAAP-48 and LHAAP-35C (53). The project management team, including the U.S. Army, U.S. Environmental

#### Dates to remember: MARK YOUR CALENDER

#### **PUBLIC COMMENT PERIOD:**

January 13, 2008 to February 14, 2008 The U.S. Army will accept written comments on the Proposed Plan during the public comment period.

**PUBLIC MEETING:** The U.S. Army will hold a public meeting to explain the Proposed Plan for LHAAP-48 and LHAAP-35C (53). Oral and written comments will be accepted at the meeting. The meeting will be held on January 29, 2008 from 6:30 p.m. to 8:30 p.m. at Karnack Community Center.

For more information, see the Administrative Record at the following location:

Public Library Marshall Public Library 300 S. Alamo Marshall, Texas 75670 Business Hours: Monday – Thursday (10:00 a.m. – 8:00 p.m.), Friday – Saturday (10:00 a.m. – 5:00 p.m.)

For further information on LHAAP-48 and LHAAP-35C (53), please contact: Dr. Rose M. Zeiler Site Manager Longhorn Army Ammunition Plant P.O. Box 220 Ratcliff, Arkansas, 72951 Phone No.: 903.679.3192 Direct No.: 479.635.0110 E-mail address: rose.zeiler@us.army.mil

Protection Agency (USEPA), and the Texas Commission on Environmental Quality (TCEQ), encourages the public to review these documents to gain a more comprehensive understanding of the environmental conditions at LHAAP-48 and LHAAP-35C (53), and also to review and comment on the recommendation for no action presented in this Proposed Plan. The U.S. Army, the lead agency for environmental response actions at LHAAP, is acting in partnership with USEPA Region 6 and TCEQ. As the lead agency, the U.S. Army is charged with planning and implementing remedial actions at LHAAP. Regulatory agencies assist the U.S. Army by providing technical support, project review, project comment, and oversight in accordance

with the Federal Superfund law and the existing Federal Facilities Agreement.

## SITE BACKGROUND

LHAAP is located in central-east Texas in the northeastern corner of Harrison County (**Figure 1**). The installation originally occupied approximately 8,500 acres between State Highway 43 at Karnack, Texas, and the western shore of Caddo Lake. The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the southeast.

Caddo Lake, a large freshwater lake situated on the Texas-Louisiana border and a drinking water source for several neighboring Louisiana communities, bounds LHAAP to the north and east.

The U.S. Army has transferred approximately 7,000 acres to the USFWS for management as The Caddo Lake National Wildlife Refuge. The property transfer process is continuing as environmental response efforts are completed at individual sites.

Due to releases of chemicals from operation and maintenance activities at the facility, LHAAP was placed on the Superfund National Priorities List (NPL) on August 9, 1990. Activities to remediate contamination associated with the listing of LHAAP as a Superfund site began in 1990. After being listed on the NPL, the U.S. Army, the USEPA, and the Texas Water Commission (currently known as the TCEQ) entered into a **CERCLA Section 120 Federal Facility** Agreement (FFA) for remedial activities at LHAAP. The FFA became effective December 30, 1991. LHAAP operated until 1997 when it was placed on inactive status and classified by the U.S. Army Armament, Munitions, and Chemical Command as excess property.

Figure 1. Location of the Longhorn Army Ammunition Plant Harrison County, Texas

The two sites discussed in this Proposed Plan have been identified to have potential environmental concerns. The most reasonably anticipated future use of LHAAP-48 and LHAAP-35C (53) is industrial or recreational as a national wildlife refuge. This anticipated future use is based on a Memorandum of Agreement (U.S. Army, 2004) between the USFWS and the U.S. Army in which the transfer process of the LHAAP acreage to USFWS is documented, to become the Caddo Lake National Wildlife Refuge. Presently the Caddo Lake National Wildlife Refuge occupies over 7,000 acres of the former installation. The property must be kept as a national wildlife refuge unless there is an act of Congress that removes the parcel or the land is exchanged in accordance with the National Wildlife Refuge System Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974.

A site description, site characteristics, and a summary of site risks are provided below separately for each site, followed by a recommendation for the sites. The location of sites LHAAP-48 and LHAAP-35C (53) are depicted in **Figure 2**.

#### LHAAP-48

LHAAP-48, also known as the Y-Area, covers an area of approximately 16 acres. The center of the site is located at the intersection of Yoakum Drive and Starr Ranch Road. LHAAP-48 was built during the construction of Plant 3 (1953-1955) and was used for the production of igniters and illumination devices. LHAAP-48 was active until about 1997. There were nine waste process sumps and three waste rack sumps associated with this area.

#### LHAAP-48 Site Characteristics

LHAAP-48 is located in the east-central portion of LHAAP (**Figure 2**). The surface features at LHAAP-48 include asphalt-paved roads and parking areas around the buildings. The perimeter of LHAAP-48 is a mixture of heavily wooded areas and grasslands. The topography slopes gently to the southeast

Figure 2. Site Location Map

and surface runoff from the northern part of the site enters a drainage ditch leading to Central Creek to the south. Runoff from the southern portion of LHAAP-48 eventually enters Central Creek to the southeast, which drains to Caddo Lake. Groundwater flow at the site has a general south and southeast flow direction.

Soil and groundwater were sampled in a phased manner between 1991 and 2005 to determine the nature and extent of contamination.

Soil samples were analyzed for some or all of the following during various phases of investigation: volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, explosive compounds, pesticides, polychlorinated biphenyls (PCBs), dioxins/furans, and perchlorate.

Soil samples were collected at several locations and depths including the areas surrounding the sumps. Detected compounds in soil included VOCs, SVOCs, metals, PCBs, pesticides, and dioxins/furans. A human health risk assessment conducted in 2003 indicated no unacceptable cancer risk or non-cancer hazard to a future maintenance worker or trespasser from the detected compounds in the soil (Jacobs, 2003).

Six monitoring wells were installed at the site for the purposes of collecting groundwater data. Five wells with stainless steel screens were installed in 1994 in the shallow groundwater-bearing zone. One well was installed in 2004 in the intermediate zone with a polyvinyl chloride (PVC) screen. Groundwater samples were collected from 1994 to 2005 and analyzed for some or all of the following during the various sampling events: VOCs, SVOCs, metals, explosive compounds, pesticides, PCBs, dioxins/furans, and perchlorate.

In 2003, a human health risk assessment indicated unacceptable risk from groundwater to a maintenance worker, primarily from thallium and dioxins detected in the early sampling rounds (Jacobs, 2003). Other metals, including arsenic, antimony, chromium, and lead were detected in groundwater in the initial sampling round above their associated maximum contaminant level (MCL). An MCL is a national primary drinking water standard.

Prior to 2003, groundwater samples were collected with methods that could agitate the water and cause particulates (solids) to be drawn into the well and become suspended in the water. If a water sample contained particulates (high turbidity), then the total concentration of the compound from both the water and the particulate matter would be provided. Turbid samples can indicate an elevated concentration of a compound that is not representative of the actual concentration in the groundwater. Turbid samples may be filtered to reduce the suspended particulates in the water to more accurately represent the compound's concentration in the water.

In 2004, as part of a data gaps investigation, additional groundwater samples were collected using a low-flow sampling method to reduce the turbidity in samples (Shaw, 2007a). Samples were collected from two shallow zone wells and one intermediate zone well and analyzed for thallium, dioxin/furans, and perchlorate. In 2005, additional groundwater samples were collected and analyzed for VOCs, metals, dioxins/furans, and perchlorate (Shaw, 2007b).

Metals detected above their MCL prior to 2004 were not detected or were detected at levels below their associated MCL in subsequent sampling events in both

filtered and unfiltered samples collected with the low-flow sampling method, with the exception of chromium (Shaw, 2007a, 2007b).

In 2004, chromium was detected in two shallow zone wells in unfiltered samples at concentrations that exceeded the MCL of 100 micrograms per liter  $(\mu g/L)$  (Shaw, 2007b). Corrosion of the stainless steel well screens and particulates in the water are suspected to have caused these readings to be elevated. In May 2005, an additional sampling event was conducted to collect and analyze filtered and unfiltered samples to determine the influence of particulates (turbidity) on the sample results. After the samples were filtered, the chromium levels were reduced (e.g., from  $2,510 \mu g/L$  to 60.7 $\mu$ g/L and 715  $\mu$ g/L to 379  $\mu$ g/L) (Shaw, 2007b). The detection of chromium exceeding the MCL in only one shallow well (LHSMW62) for the filtered samples was thought to be related to suspended sediments with the origin of chromium being from corrosion of stainless steel well screens.

In September 2006, a new PVC-screened well (48WW02) was installed near LHSMW62. Chromium concentrations in the groundwater from the new PVC well were below the MCL, which indicates that corroded stainless steel well screen materials were the source of the elevated chromium results (Shaw, 2007b).

SVOCs, explosive compounds, pesticides, or PCBs were not detected or were detected at low levels in the groundwater samples in all sampling rounds.

The only detected VOC to exceed the MCL was trichloroethene (TCE) in a 1996 sampling round with a concentration of 9  $\mu$ g/L, which exceeds the MCL for TCE of 5  $\mu$ g/L. However, since 1998, TCE has not been detected.

Dioxin/furan compounds were detected in all the sampling rounds. Dioxin/furans are a family of compounds comprised of individual compounds called congeners. To evaluate dioxins, a 2,3,7,8tetrachlorodibenzo-*p*-dioxin (TCDD) toxicity equivalent quotient (TEQ) concentration is calculated using toxicity equivalent factors (TEFs) for the individual congeners (Van den Berg, et al., 1998). (See Glossary of Terms for further explanation.) The 2,3,7,8-TCDD TEQ is compared to the MCL for 2,3,7,8-TCDD of 30 picograms per liter (pg/L). The calculated 2,3,7,8-TCDD TEQ based on all sampling data was below the MCL (Shaw, 2007b).

Perchlorate was not detected in groundwater at LHAAP-48.

## Summary of LHAAP-48 Risks

Risks to human health (industrial workers and residential users) and to ecological receptors were evaluated and are discussed below.

## Human Health Risks

## Soil

The Remedial Investigation Report (Jacobs, 2002) and the Baseline Human Health Risk Assessment and Screening Ecological Risk Assessment (Jacobs, 2003) evaluated the data through 1998 for LHAAP-48 to determine current and future effects of contaminants on human health, and to support technical review and risk management decisions. An industrial risk assessment evaluates the risk to a worker who is not residing at the site, while residential risk evaluates the potential exposure for a resident. Thus, the baseline residential human health risk assessment presents a more conservative approach than an industrial risk assessment. As part of the Site Evaluation Report (Shaw, 2007b), a baseline human health risk assessment was conducted for

LHAAP-48 to determine the effects of contaminants in groundwater and soil for a hypothetical future residential user. The baseline residential human health risk assessment (Shaw, 2007c) was conducted using data reported in the baseline human health risk assessment for industrial use (Jacobs, 2002) supplemented by data from subsequent sampling events (Shaw, 2007a, 2007b).

The NCP, 40 Code of Federal Regulations Part 300, established a range of acceptable levels of cancer risk for Superfund sites. These values range between a higher risk of one in 10,000 and a lower risk of one in 1 million additional cancer cases if cleanup action is not taken at a site. Expressed in scientific notation, this translates to an acceptable risk range of  $1 \times 10^{-4}$  to  $1 \times 10^{-6}$  over a defined period of exposure to site-related contaminants.

In addition to a cancer risk, chemical contaminants that are ingested, inhaled, or dermally absorbed may present noncancer hazards to different organs of the human body. The non-cancer hazard of toxic effect is expressed as a hazard index (HI). USEPA considers an HI exceeding 1.0 to be an unacceptable non-cancer hazard.

The human health risk assessment for a future industrial worker indicated acceptable cancer risk and non-cancer hazard from the soil within 0-2 feet bgs at LHAAP-48. The calculated risk was within the acceptable range at  $1.4 \times 10^{-5}$  and the HI of 0.088 was less than 1 (Jacobs, 2003).

The risk to future residents from soil was evaluated using data collected prior to the Jacobs (2003) industrial risk assessment. Results of the assessment of risk to hypothetical residents from exposure to chemicals in soil at LHAAP-48 indicate that cumulative potential risks are within the acceptable range, with the cancer risk of  $6 \times 10^{-5}$  and the HI of 0.4 was less than 1 (Shaw, 2007b), even though estimated risks associated with dioxins and vinyl chloride exceed  $1 \times 10^{-6}$ . A risk management approach to take no further action at LHAAP-48 meets the Risk Reduction Standard 3 requirement that the cumulative excess cancer risk to exposed populations (including sensitive subgroups) shall not be greater than  $1 \times 10^{-4}$  [30 TAC §335.563(b)].

## Groundwater

The groundwater was determined to pose an unacceptable cancer risk of  $1.3 \times 10^{-4}$ and an unacceptable HI of 36 to the future maintenance worker under the industrial use scenario. Approximately 95 percent of the total groundwater cancer risk for an industrial user ( $1.2 \times 10^{-4}$ ) was from 2,3,7,8-TCDD. Thallium generated an HI of 25 and accounted for approximately 69 percent of the groundwater HI (Jacobs, 2003).

Additional groundwater sampling conducted at LHAAP-48 in 2004 and 2005 suggests that elevated concentrations of dioxins/furans and metals were due to the high turbidity of the groundwater samples. Metals, including thallium, arsenic, antimony, and lead were not detected or were detected at levels below their associated MCL when samples (both unfiltered and filtered) were collected with the low-flow sampling method (Shaw, 2007a, 2007b). Dioxins were also not detected or detected at low concentrations, and the calculated 2,3,7,8-TCDD TEQ was below the MCL (Shaw, 2007b).

Chromium was detected at concentrations above the MCL in the low-flow unfiltered samples from two stainless steel wells (Shaw, 2007b). After filtering the samples, chromium only exceeded the MCL in one well. The groundwater results (unfiltered and filtered) from the new PVC-screened well did not have detections of chromium above the MCL (Shaw, 2007b). Thus, it can be concluded that the source of the isolated high chromium readings in the groundwater was corrosion of the stainless steel well components, and the groundwater in the area meets the requirements of the Safe Drinking Water Act.

The other contaminants, including dioxins/furans associated with human health risk in the industrial risk assessment (Jacobs, 2003), were either not detected or were below MCLs.

Therefore, no action is necessary at LHAAP-48 due to a future residential user's exposure to soil or groundwater.

#### Ecological Risk

The ecological risk for the site LHAAP-48 was addressed in the installation-wide **Baseline Ecological Risk Assessment** (BERA) (Shaw, 2007c). For the BERA, the entire installation was divided into three large sub-areas (i.e., the Industrial Sub-Area, Waste Sub-Area, and Low Impact Sub-Area) for the terrestrial evaluation. The individual sites at LHAAP were grouped into one of these sub-areas, which were delineated based on commonalities of historic use, habitat type, and spatial proximity to each other. The conclusions regarding the potential for chemicals detected at individual sites to adversely affect the environment must be made in the context of the overall conclusions of the sub-area in which the site falls. Site LHAAP-48 lies within the Industrial Sub-Area.

The BERA concluded that no unacceptable risk was present in the Industrial Sub-Area (Shaw, 2007c) and therefore, no further action is needed at LHAAP-48 for the protection of ecological receptors.

## LHAAP-35C (53)

LHAAP-35C (53) was a former static test area used for testing of illumination devices and static test firing of rocket motors and covers an area of approximately 40.3 acres. Structures for this site included a test tunnel and a data acquisition system for flares, rocket motor test stands of earth and concrete, and conditioning facilities for reproducing arctic and tropical temperatures. The site was active through 1998. Four waste process sumps were associated with this area (Jacobs, 2002).

#### LHAAP-35C (53) Site Characteristics

LHAAP-35C (53) is located in the eastcentral portion of LHAAP (**Figure 2**). The surface features at LHAAP-35C (53) include a mixture of asphalt-paved roads and parking areas around the former structures in the area. Central Creek borders the site to the northwest and Harrison Bayou borders the site to the southeast. Surface drainage flows predominantly to the southeast. Groundwater flow at the site has a general northeast direction.

Soil and groundwater were sampled in a phased manner between 1982 and 2005 to determine the nature and extent of contamination.

Soil samples were analyzed for some or all of the following during the various phases of investigation: VOCs, SVOCs, metals, explosive compounds, pesticides, PCBs, and dioxins/furans. Detected compounds in soil included VOCs, SVOCs, metals, pesticides, and dioxins/furans. A human health risk assessment conducted in 2003 indicated no unacceptable cancer risk or non-cancer hazard to a future maintenance worker from the detected compounds in the soil (Jacobs, 2003).

Six monitoring wells were installed at the site for the purpose of collecting groundwater data. One well was installed in 1982 in the shallow groundwater bearing zone. In 1994, five wells were installed with one in the intermediate zone and four in the shallow zone (Jacobs, 2002). The wells were completed with stainless steel screens. Seven temporary wells constructed of PVC materials were installed in 2003 in the shallow zone (Plexus, 2005). Groundwater samples were collected from 1982 to 2005 and analyzed for some or all of the following during the various sampling events: VOCs, SVOCs, metals, explosive compounds, pesticides, PCBs, dioxins/furans, total petroleum hydrocarbons, cyanide, and perchlorate.

Detected compounds in the water included metals, VOCs, SVOCs, dioxins/furans, and explosives. In 2003, a human health risk assessment indicated unacceptable risk from groundwater to a maintenance worker, primarily from thallium in the early sampling rounds (Jacobs, 2003). Other metals, including arsenic, lead, antimony, thallium, and chromium were detected above their associated MCL.

As discussed in the LHAAP-48 section, sampling methods used prior to 2003 could cause turbid samples. In 2003/2004, temporary PVC wells were installed to determine if there was a potential source of chromium contamination at the site (Plexus, 2005). Many of the groundwater samples had high turbidity readings and were filtered prior to analysis. Chromium was not detected in these samples (Plexus, 2005).

In 2004 and 2005, additional groundwater samples were collected using a low-flow sampling method to reduce the turbidity in samples (Shaw, 2007a, 2007b). These samples were collected from five shallow wells and one intermediate well and analyzed for VOCs, metals, dioxin/furans, and perchlorate. Groundwater samples were also collected in 2005 from three of the temporary wells and were analyzed for VOCs and metals to determine if chromium and VOCs were pervasive at the site (Shaw, 2007b).

The 2004/2005 sampling using low-flow methods did not detect thallium above its MCL in filtered or unfiltered samples (Shaw, 2007a, 2007b; Plexus, 2005). Chromium was only detected once in an unfiltered sample at a concentration of 171  $\mu$ g/L. After filtering the sample, chromium had an estimated (J qualified) concentration of 3.37J µg/L, which is well below the MCL of 100 µg/L (Shaw, 2007b). This indicates that the elevated chromium concentration in the unfiltered sample was due to the turbidity of the sample. The suspended solids in the water were likely to have originated from the corrosion of stainless steel well materials indicated by the elevated concentrations of metals associated with stainless steel, such as nickel (Shaw, 2007b). Additional evidence that chromium is not a site-related chemical at the site was provided by Jacobs (2002) and Plexus (2005). These studies indicate that a source of chromium is not present in the site soils.

Detection of metals appears to be sporadic or to marginally exceed MCLs, appears to be related to the poor quality of the samples (turbidity), and not representative of the groundwater in the surrounding soil. Metals in the groundwater do not pose a current threat to human health (Shaw, 2007b).

SVOCs, explosive compounds, pesticides, perchlorate, or PCBs were not detected or were detected at low levels in the

groundwater samples in all sampling rounds.

VOCs, including TCE,1,2-dichloroethane, and bis(2-ethylhexyl)phthalate were detected in groundwater in the early sampling rounds prior to 1998 at concentrations above their MCLs. In 2003/2004, temporary wells were installed to determine the presence or absence of VOCs that were detected in the early sampling round. A few VOCs were detected at low concentrations below MCLs in the 2003/2004 sampling event (Plexus, 2005). Sampling to verify the presence of contaminants above MCLs did not confirm earlier detections (Plexus, 2005). In later sampling rounds, VOCs were not detected or were detected at levels below their MCLs (Shaw, 2007a, 2007b) with the exception of TCE in one temporary well where TCE was detected at 5.01  $\mu$ g/L, marginally above the MCL of 5 µg/L (Shaw, 2007b).

Dioxin/furan compounds were detected in all the sampling rounds. The calculated 2,3,7,8-TCDD TEQ based on all sampling data was below the MCL of 30 pg/L (Shaw, 2007b) (see LHAAP-48 for discussion on TEQ).

## Summary of LHAAP-35C (53) Risks

Risks to human health (industrial and residential user) and to ecological receptors were evaluated and are discussed below.

## Human Health Risks

## Soil

The Remedial Investigation Report (Jacobs, 2002), and the Baseline Human Health Risk Assessment and Screening Ecological Risk Assessment (Jacobs, 2003) evaluated the data for LHAAP-35C (53) through 1998 to determine current and future effects of contaminants on human health, and to support technical review and risk management decisions.

An industrial risk assessment evaluates the risk to a worker who is not residing at the site, while residential risk evaluates the potential exposure for a resident. As part of the Site Evaluation Report (Shaw, 2007b), a baseline human health risk assessment was conducted for LHAAP-35C(53) to determine the effects of contaminants in groundwater and soil for a hypothetical future residential user. The baseline residential human health risk assessment (Shaw, 2007c) was conducted using data reported in the baseline human health risk assessment for industrial use (Jacobs, 2002) supplemented by data from sampling events conducted by Shaw in 2005 and 2006. Detected compounds were screened as required by TCEQ guidance to determine if they were a chemical of potential concern to a future residential user.

The NCP, 40 Code of Federal Regulations Part 300, established a range of acceptable levels of cancer risk for Superfund sites. These values range between a higher risk of one in 10,000 and a lower risk of one in 1 million additional cancer cases if cleanup action is not taken at a site. Expressed in scientific notation, this translates to an acceptable risk range of  $1 \times 10^{-4}$  to  $1 \times 10^{-6}$  over a defined period of exposure to site related contaminants.

In addition to cancer risk, chemical contaminants that are ingested, inhaled, or dermally absorbed may present noncancer hazards to different organs of the human body. The non-cancer hazard of toxic effect is expressed as an HI. USEPA considers an HI exceeding 1.0 to be an unacceptable non-cancer hazard.

The human health risk assessment for a future industrial worker indicated acceptable cancer risk and non-cancer hazard from soil at LHAAP-35C (53). The calculated risk for an industrial worker was within the acceptable range at

 $1.2 \times 10^{-5}$  and the noncancer HI was 0.053 (Jacobs, 2003).

The risk to future residents from soil was evaluated using data collected prior to the Jacobs (2003) industrial risk assessment. Results of the assessment of risk to hypothetical residents from exposure to chemicals in soil at LHAAP-35C (53) indicate that potential risks are within the acceptable range with a cancer risk of  $8 \times 10^{-6}$  and the HI of 0.3 was less than 1 (Shaw, 2007b), even though estimated risks associated with dioxins exceed  $1 \times 10^{-6}$ .

A risk management approach to take no further action at LHAAP-35C (53) meets the Risk Reduction Standard 3 requirement that the cumulative excess cancer risk to exposed populations (including sensitive subgroups) shall not be greater than  $1 \times 10^{-4}$  [30 TAC §335.563(b)].

## Groundwater

The groundwater was determined to have a cancer risk within the acceptable range at  $8 \times 10^{-5}$  and an unacceptable noncancer hazard with an HI of 22 to the future maintenance worker under the industrial use scenario (Jacobs, 2003). Thallium generated an HI of 22 and accounted for approximately 99 percent of the groundwater HI (Jacobs, 2003). In subsequent samples collected by low-flow methods (used to minimize turbidity). thallium concentrations were below the MCL (Shaw, 2007b). Compounds that were detected in early sampling rounds were either not detected or were detected at low concentrations below or marginally above their MCLs. Thus, contaminants in groundwater associated with human health risk in previous industrial risk assessments were either not detected or were below MCLs.

Therefore, no action is necessary at LHAAP-35C (53) due to a future residential or industrial user's exposure to soil or groundwater.

## Ecological Risk

The ecological risk for the site LHAAP-35C (53) was addressed in the installation-wide Baseline Ecological Risk Assessment (BERA) (Shaw, 2007c). For the BERA, the entire installation was divided into three large sub-areas (i.e., the Industrial Sub-Area, Waste Sub-Area, and Low Impact Sub-Area) for the terrestrial evaluation. The individual sites at LHAAP were grouped into one of these sub-areas, which were delineated based on commonalities of historic use, habitat type, and spatial proximity to each other. The conclusions regarding the potential for chemicals detected at individual sites to adversely affect the environment must be made in the context of the overall conclusions of the sub-area in which the site falls. Site LHAAP-35C (53) lies within the Industrial Sub-Area.

The BERA concluded that no unacceptable risk was present in the Industrial Sub-Area (Shaw, 2007c) and therefore, no further action is needed at LHAAP-35C (53) for the protection of ecological receptors.

## RECOMMENDATION

No action is proposed for both LHAAP-48 and LHAAP-35C (53). This recommendation is based on the existing data and determination of no unacceptable risk to human health, and compliance with the MCLs. Because there are no unacceptable risks, and chemicals in groundwater have concentrations below MCLs, no remediation alternatives or Remedial Action Objectives are required. A Record of Decision based on this recommendation will allow these sites to

be removed from the list of LHAAP environmental sites requiring additional effort by the U.S. Army. The recommendation for no action is consistent with the criteria required under CERCLA.

## **COMMUNITY PARTICIPATION**

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-48 and LHAAP-35C (53) through public meetings, the Administrative Record file for the facility, and announcements published in the Shreveport Times and Marshal News Messenger newspapers. The public is encouraged to gain a more comprehensive understanding of these sites.

The dates for the public comment period, the date, location, and time of the public meeting, and the locations of the Administrative Record files are provided on the front page of this Proposed Plan.

Any significant changes to the Proposed Plan, as presented in this document, will be identified and explained in the Record of Decision.

#### GLOSSARY OF TERMS

Administrative Record — The body of reports, official correspondence, and other documents that establish the official record of the analysis, cleanup, and final closure of a CERCLA site.

**Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)** — This law authorizes the Federal Government to respond directly to releases (or threatened releases) of hazardous substances that may be a danger to public health, welfare, or the environment. The U.S. Army currently has the lead responsibility for these activities.

**Dioxins** — Dioxin is not a single compound, but a family of compounds consisting of dioxins and furans with a wide range of toxicity. Dioxins are formed as an unwanted byproduct of industrial processes or from other process such as burning trash.

**Environmental Media** — A major environmental category that surrounds or contacts humans, animals, plants, and other organisms (e.g., surface water, ground water, soil, or air) and through which chemicals or pollutants move.

**Exposure** — Contact of an organism with a chemical or physical agent. Exposure is quantified as the amount of the agent available at the exchange boundaries of the organism (e.g., skin, lung, digestive tract, etc.) and available for absorption.

**Filtered Sample** — Groundwater samples filtered at the laboratory to reduce suspended particulates in the sample to more accurately depict the contaminants in the water.

**Groundwater** — Underground water that fills pores in soil or openings in rocks to the point of saturation.

**Hazard Index** — Where appropriate, the sum of more than one chemical-specific hazard quotients and/or multiple exposure pathways. When the hazard index exceeds unity, there may be concern for potential health effects.

**Hazard Quotient** —The ratio of a receptor's estimated chemical intake ("dose") to a reference dose for that chemical.

Low-flow Sampling Method — Prior to 2003, groundwater samples at LHAAP were collected with high volume pumps or bailers that could potentially agitate the water in the well and cause particulates to be suspended in the water. If particulates are suspended in a water sample (turbid sample), concentrations of the compounds in the water can be elevated since the analysis will provide results of both the water and particulates. New sampling methods using a low-flow method to reduce the suspension of particulates in the samples were implemented in the most recent sampling rounds. **Maximum Contaminant Level (MCL)** — The maximum contaminant level is based on the National Primary Drinking Water Standard. The TCEQ has adopted MCLs at the regulatory cleanup level for both industrial and residential uses. Any detected compounds in the groundwater samples with an MCL were evaluated by comparing them to their associated MCL. MCL comparisons are performed using an average or other site-representative concentration.

**Proposed Plan** — A report for public comment highlighting the key factors that form the basis for the selection of the preferred remediation alternative.

**Remedial Action** — The actual construction or implementation phase of a Superfund site cleanup that follows remedial design.

**Risk Assessment** — An analysis of the potential adverse health effects (current and future) caused by hazardous substances at a site in the absence of any actions to control or mitigate these releases (i.e., under an assumption of no action). The assessment contributes to decisions regarding appropriate response alternatives.

**Superfund** — The common name used for CERCLA; also referred to as the Trust Fund. The Superfund Program was established to help fund cleanup of hazardous waste sites. It also allows legal action to force those responsible for sites to clean them up.

**Toxicity Equivalent Factor (TEF)** — The toxicity equivalent factor is the factor used with the individual dioxin family members that represents its toxicity potency, with the most potent having a factor of 1 and the least toxic members have the lowest factors (Van den Berg et al., 1998). The TEFs are used along with the concentrations of the individual dioxin family members to calculate the TEQ.

**Toxicity Equivalent Quotient (TEQ)** — A value that is the sum of the products of the individual family (e.g., furans) member compound concentrations multiplied by their TEFs. The product's sum represents the toxicity of an equivalent concentration of 2,3,7,8-tetrachlorodibenzop-dioxin (2,3,7,8-TCDD).

Re: Memorandum: LHAAP-59 SPLP Soil Sample Analyses

Dear Ms. Duke:

The purpose of this letter and enclosed memorandum is to document the Administrative Record with the results of two soil samples collected for Synthetic Precipitation Leaching Procedure (SPLP) analysis at LHAAP-59 after finalization of the Site Investigation Report (August 2007). These samples were collected in response to your letter dated September 12, 2007 requesting confirmation of 59SB01-0-1FT. Results of the analyses confirmed that alpha- and gamma-chlordane concentrations in soil at this site do not present the potential for a future release of leachate in excess of Texas groundwater Medium-Specific Concentrations (MSC).

Point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.zeiler@us.army.mil.

Sincerely, Kisem Zuler

Rose M. Zeiler, Ph.D. Longhorn AAP Site Manager

RE: Analysis of Soil Samples Collected from LHAAP-59 on September 14, 2007

The document *Final Site Investigation Report LHAAP-59, Longhorn Army Ammunition Plant, Karnack, Texas,* was submitted for review by the Texas Commission on Environmental Quality (TCEQ) in August 2007. The document included an assessment of a soil sample (59SB01A-0-1FT) using the Synthetic Precipitation Leaching Procedure (SPLP) as provided by the TCEQ Risk Reduction Rules (30 TAC §335). The report concluded that the concentrations of alpha-chlordane, gamma-chlordane, and heptachlor epoxide in both soil and SPLP leachate were below their respective TCEQ Medium-Specific Concentrations (MSCs), and that no further action is required.

The TCEQ noted that the concentrations of the two chlordane isomers in sample 59SB01A-0-1FT, which was collected on June 21, 2007, were significantly less than the concentrations in the original sample 59SB01-01 (collected on August 2, 2006) and suggested that two additional samples be collected near 59SB-01 to confirm the absence of elevated pesticide levels in the area. Therefore, Shaw collected two additional samples on September 14, 2007 from points five feet to the north and south of the subject location. The samples were 59SB01A-North (0-1) and 59SB01A-South (0-1), and a field duplicate sample (59SB01A-South-FD).

Analytical results for the above two soil samples and of SPLP leachate for the two subject pesticides are shown in **Table 1.** Alpha- and gamma-chlordane concentrations in the soil samples (**Table 1b**) confirm variability at the 59SB01 sampling location. Alpha- and gamma-chlordane concentrations in sample 59SB01A-North (0-1) exceed the groundwater protective MSC for soil (GWP-Ind). The sample from the 59SB01A-South (0-1) location has pesticide concentrations below GWP-Ind levels.

Results of the SPLP analysis indicate that alpha- and gamma-chlordane were either not detected in SPLP leachates or were detected at concentrations below the MSC for groundwater (GW-Ind) (**Table 1a**). Because these leachate concentrations are below GW-Ind MSCs, the results demonstrate that these chemicals in soil do not pose the potential for a future release of leachate in excess of groundwater MSC values and are considered to be protective for nonresidential worker exposure, as specified in 30TAC§335.559(g)(2)(B).

Soil concentrations of alpha- and gamma-chlordane in soil are below risk-based TCEQ MSCs that are protective of industrial workers from direct contact with chlordane isomers by inhalation, ingestion, and dermal exposure (SAI-Ind values shown in **Table 1b**). Because these comparisons show that chlordane concentrations are protective of groundwater and of workers potentially exposed by direct contact with soil, the resampling effort of September 14, 2007 indicates that no further action is required at the 59SB01 location at LHAAP-59.

Table 1a

#### Concentrations of Chemicals in Leachate from Synthetic Precipitation Leaching Procedure (SPLP) (SW-846 Method 1312) Conducted on Soil Samples from LHAAP-59 Longhorn Army Ammunition Plant

## TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

January 16, 2008

Ms. Rose Zeiler Army / BRAC Site Manager Longhorn Army Ammunition Plant Post Office Box 220 Ratcliff, AR 72951

#### Re: Longhorn Army Ammunition Plant (LHAAP) Final Site Investigation Report, Revision 1 for LHAAP-06, LHAAP-07, LHAAP-51, LHAAP-55, LHAAP-64, LHAAP-66, and LHAAP-68

Dear Ms. Zeiler:

The Texas Commission on Environmental Quality (TCEQ) has completed review of the Final Site Investigation Report, Revision 1 for LHAAP-06, LHAAP-07, LHAAP-51, LHAAP-55, LHAAP-64, LHAAP-66, and LHAAP-68 (Shaw Environmental, Inc., December 2007). The report summarizes the results of the additional sampling and recommends no further action for soil at these sites. We concur that the above referenced sites can be closed under the Texas Risk Reduction Rule Standard 2 (RRR Std 2) for non-residential settings.

We concur that no active remediation is necessary at these sites. However, in order to comply with the non-residential soil requirements for RRR Standard 2, site closure, a deed certification must be filed in the county record. The deed certification must indicate that future land use is considered suitable for non-residential use. An example format of the deed certification is provided in 30 Texas Administrative Code §335.569.

If you have any questions or need additional information, please feel free to contact me at (512) 239-2139.

Sincerely

Fay Duke, Project Manager Team 2, Environmental Cleanup Section II Remediation Division

Protecting Texas by Reducing and Preventing Pollution

January 17, 2008

Ms. Rose Zeiler Army / BRAC Site Manager Longhorn Army Ammunition Plant Post Office Box 220 Ratcliff, AR 72951

Re: Longhorn Army Ammunition Plant (LHAAP) TCEQ Reference Number: SUP126 Comprehensive Land Use Control Management Plan

Dear Ms. Zeiler:

The Texas Commission on Environmental Quality (TCEQ) has completed review of the Comprehensive Land Use Control (LUC) Management Plan. The purpose of this management plan is to ensure that all site-specific LUCs are compiled into one comprehensive location for both pre-transfer and post-transfer use. We have no comments but have the following request. To ensure that future land use is consistent with the assessment scenario, we recommend that the LUC Management Plan include the land use restriction notices for all environmental restoration sites remediated or closed based on industrial land use criteria.

If you should have any questions or need additional information, please feel free to contact me at (512) 239-2443.

Sincerely

ð.!

| Fay Duke – Texa | s Commission on Env      | ironmental Quality  |                |  |                |
| General         |                          | The Texas Commission on Environmental Quality<br>(TCEQ) has completed review of Draft Final Data<br>Evaluation Report (Shaw Environmental, Inc., August<br>2007). This report presents an evaluation of chemical<br>concentrations in Soil samples associated with the 126<br>wastewater sumps and 20 waste rack sumps, known<br>collectively as site LHAAP 35/36 at the Longhorn Army<br>Ammunition Plant Superfund Site.  | С              | Noted.   | A              |
|                 |                          | These sumps were previously investigated by the U.S.<br>Army Corps of Engineers and Army contractors and<br>subsequently closed. The closures of most of the<br>sumps have been approved by TCEQ. However, it was<br>determined additional evaluations of the soil around the<br>former sumps were required. Although various soil<br>data associated with each of the sumps have previously<br>been collected for the 2002 and 2003 baseline risk<br>assessment reports for the majority of the sump sites,<br>it was determined that additional soil data around the<br>sumps were necessary to complete the evaluation of<br>the risk posed by soil around these sumps. The report<br>summarized the results of the additional data collection<br>and risk evaluation to determine whether the additional<br>data would change the conclusions of the previous risk<br>assessments. Our comments/approval are provided<br>below. |                |  |                |
| 1               |                          | Soil samples collected adjacent to sumps associated<br>with sites LHAAP-04, -29, -39 and -66 have<br>concentrations below the TCEQ Risk Base Screening<br>Values (RBSVs). Therefore, we concur that no active<br>remediation would be required for soil around these<br>sumps for the protection of human exposure to on-site<br>soil. However, we note that additional evaluation may<br>be necessary to ensure concentrations in soil would not<br>serve as a continuous source of contamination to<br>groundwater and surface water.   | C              | The sites in this report are being evaluated<br>according to Risk Standard 3. The use of RBSVs is<br>described in the July 23 <sup>rd</sup> , 1998 TCEQ<br>memorandum entitled, <i>Implementation of the<br/>Existing Risk Reduction Rule</i> , hereafter referred to<br>as the Consistency Memorandum. Section III of<br>the Consistency Memorandum provides for the use<br>of RBSVs to further identify contaminants which<br>do not need to be included in the baseline risk<br>assessment required under Standard 3. | A              |

 Commenter Agrees (A) with response, or Does not Agree (D) with response.

| 10.00 | Comment Page | Section/ | Comment | C, D <sup>1</sup> , Response C  | or .<br>)2 |
|-------|--------------|----------|---------|---|------------|
| 2     |              |          |         | Generally stated, the 2002 and 2003 risk<br>assessments by Jacobs concluded that risks<br>associated with chemicals in soil at Group 2 and<br>Group 4 sites were within the acceptable range.<br>The purpose of the subject document is to<br>determine whether soil data collected in 2005 and<br>2006 from former sump locations would change<br>the conclusions of the original risk assessments.<br>This was accomplished by comparing chemical<br>concentrations to Standard 3 RBSVs and, where<br>applicable, to exposure point concentrations of the<br>original risk assessments. The subject report<br>indicates that the conclusions of the original risk<br>assessments are still valid, i.e. the risk from the<br>soil is acceptable. |            |
|       |              |          |         | Baseline risk assessments account for risk<br>associated with exposure to groundwater by<br>directly estimating risk from chemicals detected in<br>groundwater. The contribution of chemicals<br>transported from soil is captured in the direct<br>assessment of groundwater contamination.  |            |
|       |              |          |         | It is important to note that the soil around the<br>sumps, as addressed in the subject report,<br>represents a very minor fraction as compared to<br>the entire sites where the majority of the sumps<br>were physically located (e.g. LHAAP-29, 46, and<br>47). As documented in this report, and concurred<br>by the regulators in their comments, the soil at the<br>former sump locations does not pose a direct<br>contact human health risk. Potential impacts to<br>groundwater and surface water should be<br>evaluated on a larger area basis and will be<br>addressed, where applicable, in feasibility studies<br>for the entire LHAAP sites within which the sumps<br>were physically located.  |            |

|         |      |          | Room with a subminister of a subminister and a subminister of a subminister of a subminister of a subminister o  |                             | The purpose of this document and its relation to feasibility studies and response actions at other sites will be clarified in the objective section of the revised document.  |                        |
| 2       |      |          | Previous risk assessment indicated acceptable risk to an industrial worker from exposure to chemicals in soil from sites LHAAP-18/24, -35(58), -46, and -47. For soil samples collected adjacent to sumps associated with sites LHAAP-18/24, -35A(58, -46, and -47 that have concentrations above the RBSVs, exposure point concentrations for chemicals which exceeded the RBSV were developed. The evaluation of the exposure point concentration values developed using the sampling results subsequent to the 2003 risk assessment indicates that the additional data contributes negligible increases to the cancer risk and noncancer hazard values of the previous risk assessment with resulting risk values still in the acceptable range. Therefore, we concur that no active remediation would be required for soil around these sumps for the protection of human exposure to on-site soil at LHAAP-, 18/24, 35A(58), -46 and -47. However, we note that additional evaluations are necessary to ensure concentrations in soil would not serve as a continuous source of contamination to groundwater and surface water. | С                           | See above response.   | A                      |
|         |      |          | This is especially imperative in the area surrounding<br>Building 25C where perchlorate contamination was<br>observed to have migrated into the surface water. We<br>understand a cover was placed in areas adjacent to<br>Building 25C as a temporary abatement. We believe<br>that a permanent remedy should be evaluated to ensure<br>that contaminated soil would not impact the surface   |                             | Regarding perchlorate contamination in the soil<br>near Building 25C, a permanent remedy is being<br>evaluated in the feasibility study for site LHAAP-47<br>that will address the risk from direct contact with<br>soil as well as impact to groundwater and surface<br>water. |                        |
| 3       |      |          | Additionally, please note that under the Risk Reduction<br>Rule, site closure/remediation, in order to comply with<br>the non-residential soil requirements, a deed  | С                           | Concur. If required, notifications will be filed for<br>the sites within which the sumps are physically<br>located.   | A                      |

## **Review Comments to**

Draft Final Data Evaluation Report, Chemical Concentration in Soil Samples Associated with LHAAP-35/36 Sumps Longhorn Army Ammunition Plant, Karnack, Texas Dated August 2007

## 00065814

|              |        |                       | certification must be filed in the county record. The<br>deed certification must indicate that future land use is<br>considered suitable for non-residential use. An example<br>format of the deed certification is provided in 30 Texas<br>Administrative Code §335.569.   |                             |  |                        |
| 4            |        |                       | Finally, we note that many soil samples analyzed for<br>semivolatiles (SVOCs) were diluted and yet no SVOC<br>compounds were detected. The dilution of samples<br>resulted in an elevation of sample quantitation limits<br>that exceeded the RBSVs. Please provide the rationale<br>for the need to dilute these samples.    | C                           | Section 4.1.1 of the report describes the role of<br>dilution factors in the data evaluation, and specific<br>applications of dilution factors are described for<br>each sump location where they occur. Because<br>sample dilution might result from several causes,<br>the following text will be inserted at the end of<br>paragraph 4 of Section 4.1.1. called Sample<br>Quantitation Limit (SQL):<br>Some samples required dilution to quantitate a<br>chemical initially present at high concentrations<br>that exceeded the linear range of instrument<br>response. Other dilutions were required by matrix<br>interference, (e.g., soil properties that interfere<br>with an extraction step, or an extract that could<br>not be evaporated down to the required 1mL<br>volume before analysis). For such samples, the<br>analyst prepares samples with increasing dilution<br>factors. The analytical results are reported for the<br>lowest dilution that provides measurements within<br>the linear response range, and meets quality<br>control criteria. The diluted samples are identified<br>in Section 4 tables by showing the dilution factor<br>for each sample. | A                      |

# 1.0 Introduction

This report, prepared by Shaw Environmental, Inc. (Shaw) for the U.S. Army Corps of Engineers (USACE), Tulsa District, under Task Order DS02 of the Louisville District's Multiple Award Remediation Contract (MARC) No. W912QR-04-D-0027, presents an evaluation of chemical concentrations in soil samples associated with wastewater sumps near process facilities at the former Longhorn Army Ammunition Plant (LHAAP) near Karnack, Texas. The sumps were physically located within or near sites LHAAP-04, 18, 29, 39, 46, 47, 48, 35C(53), 35A(58), 59, and 66, and have been collectively designated as site LHAAP-35/36, with 125 wastewater sumps in LHAAP-35 and 20 waste rack sumps in LHAAP-36.

The sumps were previously investigated by the U.S. Army Corps of Engineers (USACE, 1994 and 1995). Forty wastewater sumps were subsequently removed and closed under Resource Conservation and Recovery Act (Thiokol Corporation [Thiokol], 1996). The 1996 closure report was approved via a 1997 correspondence from the Texas Natural Resource Conservation Commission (TNRCC, 1997). The closure of 85 additional wastewater sumps was reported in a report by OHM Remediation Services Corp. (OHM, 1997). While all of the wastewater sumps were closed, the documentation included in TNRCC (1997) and closure certifications included in OHM (1997) indicated that the soil around the former sumps required further evaluation. No documentation related to the closure of the 20 waste rack sumps was found.

Environmental sampling and analysis efforts at the sumps and in the areas surrounding them are described in the Remedial Investigation (RI) reports (Jacobs Engineering Group, Inc. [Jacobs], 2001, 2002a) and baseline risk assessments for LHAAP sites (Jacobs, 2002b, 2003). Documentation pertaining to investigations, closure, and removal of sumps is included in various reports (USACE, 1995; Thiokol, 1996; OHM, 1997). Several of these reports were not previously included in the administrative record for LHAAP, and are included on a compact disc as **Appendix A**.

The purpose of the effort by Shaw was to collect additional samples to characterize soil around the former wastewater sump locations as required in the TNRCC correspondence so that a future course of action may be determined for each sump. The purpose was also to collect data around waste rack sumps to determine a course of action since these sumps were not evaluated previously.

# 1.1 Objectives

The objectives of this report are to: (a) compile soil data, referred to as pre-2002 data, associated with each sump that were collected for risk assessments for the majority of sump sites (Jacobs, 2002b, 2003); (b) evaluate the post-2002 data, collected primarily by Shaw in 2006, with respect

to applicable risk-based TCEQ standards to determine whether the additional data would change the conclusions of previous risk assessments; and (c) recommend a course of action for each sump. Generally stated, the previous risk assessments (Jacobs, 2002b; 2003) concluded that risks associated with chemicals in soil at Group 2 and Group 4 sites were within the acceptable range. The purpose of this report is to determine whether soil data collected in 2005 and 2006 from former sump locations would change the conclusions of the original risk assessments. The approach followed in this report is to first present post-2002 data for each sump followed by a comparison of the data to the available risk-based standards. If an exceedance of a standard is noted for a chemical, the chemical is then evaluated with respect to the risk assessment (Jacobs 2002b; 2003) for the site within which the sump was located.

Baseline risk assessments account for risk associated with exposure to groundwater by directly estimating risk from chemicals detected in groundwater. The potential contribution of chemicals transported from soil is captured in the direct assessment of groundwater contamination. The soil around the sumps represents a very minor fraction of the entire sites where the majority of the sumps were physically located. Potential impacts to groundwater and surface water should be evaluated on a larger basis and addressed through feasibility studies for the entire LHAAP sites within which the sumps were physically located.

# *1.2 Site Description*

LHAAP was active from the early 1940s to the late 1990s for the manufacturing of explosives, pyrotechnics, and rocket motors for World War II, the Korean War, and the Cold War. LHAAP was placed on inactive status in 1997. Aside from the abundant wildlife, the installation is predominantly unoccupied. Many of the production facilities have been demolished. LHAAP now consists of a heavily vegetated landscape with flat to slightly undulating terrain. Many of the production buildings had sumps that collected washdown water. Sumps were also associated with waste racks where containers (e.g. drums) were cleaned or stored.

There are 125 wastewater sumps included in LHAAP-35 and 20 waste rack sumps are included in LHAAP-36 (**Table 1-1**). The sumps were physically located within or near sites LHAAP-04, 18, 29, 39, 46, 47, 48, 35C(53), 35A(58), 59, and 66, and have been collectively designated as site LHAAP-35/36.

# 1.3 Document Organization

The field investigation activities conducted in 2006 (Shaw, 2006a,b) are summarized in **Section 2.0**. A brief description of processes that contributed wastewater to each sump, and the analytical results for soil samples associated with the sump, including those collected in previous studies, are described in **Section 3.0**. **Section 4.0** presents a comparison of chemical concentrations in samples collected subsequent to the 2002 and 2003 risk assessments to Risk

Based Screening Values (RBSVs) provided by the Texas Commission on Environmental Quality (TCEQ), and a discussion of potential risks associated with chemicals that exceed the RBSV concentrations. **Section 5.0** presents a summary of comparisons to regulatory values, and associated risks. References are provided in **Section 6.0**.

# 2.0 Field Investigation

Shaw collected soil samples near former sump locations according to the work plan (Shaw, 2006).

# 2.1 Methods

Borings were advanced at the sump locations in accordance with the investigation plan for sumps (Shaw, 2006a). All sampling locations were hand augured to 5 feet below ground surface (bgs) unless the planned boring terminated less than 5 feet bgs. No surface samples (0 to 0.5 feet bgs) were analyzed for volatile organic compounds (VOCs). Borings deeper than 5 feet bgs were advanced using direct push technology.

# 2.2 Sample Locations

Sample locations were selected upon review of existing information (Shaw, 2006). Because previous risk assessments showed that no further action is required at LHAAP-48 and -35C(53), sumps addressed in those assessments were excluded from this evaluation (**Table 1-1**).

Seven of the 145 sumps in LHAAP-35/36 were excluded from further investigation based on a review of results of previous information (USACE 1995; Thiokol, 1996; OHM, 1997; Jacobs, 2001, 2002b). Nineteen additional sumps and waste rack sumps were described in the previous risk assessments and evaluation reports for sites LHAAP-48/35C(53) and LHAAP-059, and were excluded from further sampling. Sump 084 and Sump 106 are located sufficiently close that the same soil samples served to characterize the associated soil potentially affected by both sumps. Although LHAAP-45 was transferred to the U.S. Fish and Wildlife Service, one waste rack sump located adjacent to the site, WRSump013, was included in this evaluation (**Table 1-1**).

For the purpose of investigation and presentation of results, the sumps were divided into subareas. Sub-Area 1 includes sumps located within site LHAAP-46 (**Figure 2-1**). Sub-Area 2 includes sumps located within LHAAP-47, and one sample from LHAAP-35B(37) (**Figure 2-2**). Sub-Area 3 includes sumps from LHAAP-04, 35A(58), 59, 60, 66, 68, and 69 (**Figure 2-3**). Sub-Area 4 includes sumps from LHAAP-18, and 39 (**Figure 2-4**). Sub-Area 5 Part 1 includes a sump located northwest of LHAAP-29 (**Figure 2-5**); Sub-Area 5 Part 2 includes a sump near LHAAP-45 (**Figure 2-6**).

The samples collected at each former sump location are presented in **Section 3.0**, which includes a brief description of the LHAAP processes in specific buildings, and process related chemicals that were related to each sump. This information was developed from RI reports (Jacobs, 2001, 2002a) and the subsequent environmental site assessment document (Plexus, 2005).

# 3.0 Sample Results

For each former sump location in LHAAP-35/36, this section presents a brief summary of production operations and the results of sampling and analysis associated with the sump. The results include both the post-2002 data (primarily from the 2006 investigation by Shaw) and the pre-2002 data that served as the basis for the earlier risk assessments (Jacobs, 2002b; Jacobs, 2003). A master footnote and abbreviation legend is provided with the tables.

# 3.1 Sump-001

Sump 001 is associated with Building P-1 at LHAAP-46. Building P-1 was used as an aluminum weighing building. The building stored metal powders used in the manufacture of the Atomic Explosion Simulator and signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-1 include aluminum, boron, hexamethylenetetramine, magnesium, vinyl chloride, silicon, tungsten, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-1**.

# *3.2 Sump-002*

Sump 002 is associated with Building P-3 at LHAAP-46 Building P-3 was used as an oxidizer process building for blending and drying black powder and processing sodium nitrate. Building use included storage of lead oxide, barium nitrate, potassium perchlorate, and sodium oxalate used in the manufacture of signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-3 include aluminum, barium chromate, cesium nitrate, iron oxide, barium nitrate, magnesium, perfluorooctanoic acid, potassium perchlorate, potassium nitrate, potassium sulfate, sodium nitrate, strontium nitrate, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-2**.

# *3.3 Sump-003*

Sump 003 is associated with Building P-3 at LHAAP-46 Building P-3 was used as an oxidizer process building for blending and drying black powder and processing sodium nitrate. Building use included storage of lead oxide, barium nitrate, potassium perchlorate, and sodium oxalate used in the manufacture of signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-3 include aluminum, barium chromate, cesium nitrate, iron oxide, barium nitrate, magnesium, perfluorooctanoic acid, potassium perchlorate, potassium nitrate, potassium sulfate, sodium nitrate, strontium nitrate, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-3**.

#### 3.4 Sump-004

Sump 004 is associated with Building P-3 at LHAAP-46 Building P-3 was used as an oxidizer process building for blending and drying black powder and processing sodium nitrate. Building use included storage of lead oxide, barium nitrate, potassium perchlorate, and sodium oxalate used in the manufacture of signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-3 include aluminum, barium chromate, cesium nitrate, iron oxide, barium nitrate, magnesium, perfluorooctanoic acid, potassium perchlorate, potassium nitrate, potassium sulfate, sodium nitrate, strontium nitrate, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-4**.

# *3.5 Sump-005*

Sump 005 is associated with Building P-3 at LHAAP-46. Building P-3 was used as an oxidizer process building for blending and drying black powder and processing sodium nitrate. Building use included storage of lead oxide, barium nitrate, potassium perchlorate, and sodium oxalate used in the manufacture of signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-3 include aluminum, barium chromate, cesium nitrate, iron oxide, barium nitrate, magnesium, perfluorooctanoic acid, potassium perchlorate, potassium nitrate, potassium sulfate, sodium nitrate, strontium nitrate, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-5**.

# *3.6 Sump-006*

Sump 006 is associated with Building P-116 at LHAAP-46. Building P-116 was used as a mixing and consolidation building for illuminant mixing/consolidation, metal powder oxidizer and binder mixing, sodium nitrate handling, and expelling charge pack-out. In 1994, approximately 75 gallons of hydraulic oil leaked in the building (Plexus, 2005). Potential contaminants at P-116 include diesel, isopropyl alcohol, and potassium sulfate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-6**.

# 3.7 Sump-007

Sump 007 is associated with Building P-116 at LHAAP-46. Building P-116 was used as a mixing and consolidation building for illuminant mixing/consolidation, metal powder oxidizer and binder mixing, sodium nitrate handling, and expelling charge pack-out. In 1994, approximately 75 gallons of hydraulic oil leaked in the building (Plexus, 2005). Potential contaminants at P-116 include diesel, isopropyl alcohol, and potassium sulfate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-7**.

#### 3.8 Sump-008

Sump 008 is associated with Building P-117 at LHAAP-46. Building P-117 was used as a mixing and consolidation building for illuminant consolidation, sodium nitrate handling, 60/81mm pressing, and magnesium powder mixing. Mixers were cleaned using sawdust with methylene chloride (Plexus, 2005). Potential contaminants at Building P-117 include VOCs, semivolatile organic compounds (SVOCs), explosives and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-8**.

# 3.9 Sump-009

Sump 009 is associated with Building P-117 at LHAAP-46. Building P-117 was used as a mixing and consolidation building for illuminant consolidation, sodium nitrate handling, 60/81mm pressing, and magnesium powder mixing. Mixers were cleaned using sawdust with methylene chloride (Plexus, 2005). Potential contaminants at Building P-117 include VOCs, SVOCs, explosives and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-9**.

# 3.10 Sump-010

Sump 010 is associated with Building P-118 at LHAAP-46. Building P-118 was used as a small pyrotechnic item manufacturing building for pyrotechnic cartridge manufacturing involving sodium nitrate grinding, magnesium handling, trip flare consolidation, first fire dispensing, decontamination kit hand line operations, and pellet coating (Plexus, 2005). Potential contaminants at Building P-118 include acetone, diesel, isopropyl alcohol, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-10**.

# 3.11 Sump-011

Sump 011 is associated with Building P-118 at LHAAP-46. Building P-118 was used as a small pyrotechnic item manufacturing Building for pyrotechnic cartridge manufacturing involving sodium nitrate grinding, magnesium handling, trip flare consolidation, first fire dispensing, decontamination kit hand line operations, and pellet coating (Plexus, 2005). Potential contaminants at Building P-118 include acetone, diesel, isopropyl alcohol, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-11**.

# 3.12 Sump-012

Sump 012 is associated with Building P-118 at LHAAP-46. Building P-118 was used as a small pyrotechnic item manufacturing building for pyrotechnic cartridge manufacturing involving sodium nitrate grinding, magnesium handling, trip flare consolidation, first fire dispensing, decontamination kit hand line operations, and pellet coating (Plexus, 2005). Potential

contaminants at Building P-118 include acetone, diesel, isopropyl alcohol, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-12**.

# 3.13 Sump-013

Sump 013 is associated with Building P-118 at LHAAP-46. Building P-118 was used as a small pyrotechnic item manufacturing building for pyrotechnic cartridge manufacturing involving sodium nitrate grinding, magnesium handling, trip flare consolidation, first fire dispensing, decontamination kit hand line operations, and pellet coating (Plexus, 2005). Potential contaminants at Building P-118 include acetone, diesel, isopropyl alcohol, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-13**.

# 3.14 Sump-014

Sump 014 is associated with Building B-5 at LHAAP- 46. Building B-5 was used as a blender building. Potential contaminants at Building B-5 include SVOCs, VOCs, total petroleum hydrocarbons (TPH), metals, and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-14**.

# 3.15 Sump-015

Sump 015 is associated with Building B-7 at LHAAP-46. Building B-7 was used as a blender building for illuminant mixing and flare composition (Plexus, 2005). Potential contaminants at Building B-7 include acetone, aluminum, barium nitrate, boron, 2-butanone, cesium nitrate, cobalt napthenate, diesel, ferric oxide, hexamethylenetetramine, isopropyl alcohol, magnesium, potassium nitrate, potassium perchlorate, silicon, sodium nitrate, strontium nitrate, vinyl chloride, zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-15**.

# 3.16 Sump-016

Sump 016 is associated with Building B-7 at LHAAP-46. Building B-7 was used as a blender building for illuminant mixing and flare composition (Plexus, 2005). Potential contaminants at Building B-7 include Acetone, aluminum, barium nitrate, boron, 2-butanone, cesium nitrate, cobalt napthenate, diesel, ferric oxide, hexamethylenetetramine, isopropyl alcohol, magnesium, potassium nitrate, potassium perchlorate, silicon, sodium nitrate, strontium nitrate, vinyl chloride, zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-16**.

# 3.17 Sump-017

Sump 017 is associated with Building B-9 at LHAAP-46. Building B-9 was used as a pyrotechnic production building for illuminant consolidation and charging, spotting charge assembly and pack out, and flare composition drying (Plexus, 2005). Potential contaminants at Building B-9 include acetone, diesel, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-17**.

#### 3.18 Sump-018

Sump 018 is associated with Building B-9 at LHAAP-46. Building B-9 was used as a pyrotechnic production building for illuminant consolidation and charging, spotting charge assembly and pack out, and flare composition drying (Plexus, 2005). Potential contaminants at Building B-9 include acetone, diesel, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-18**.

# 3.19 Sump-019

Sump 019 is associated with Building B-10 at LHAAP-46. Building B-10 was used as a blender building to store metal powders and smoke charge powders in blender buckets used in the manufacture of the M142 Atomic Explosion Simulator. Mixing and blending of 105mm pyrotechnic rounds was also conducted in Building B-10 (Plexus 2004). Potential contaminants at Building B-10 cesium nitrate, potassium nitrate, and rubidium nitrate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-19**.

# 3.20 Sump-020

Sump 020 is associated with Building B-11 at LHAAP-46. Building B-11 was used as a blender building for illuminant mixing, first fire mixing, flare/igniter composition and intermediate charge composition (Plexus, 2005). Potential contaminants at Building B-11 include acetone, aluminum, 2-butanone, barium nitrate, cobalt napthenate, isopropyl alcohol, magnesium, potassium nitrate, potassium perchlorate, silicon, strontium nitrate, vinyl chloride, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-20**.

# 3.21 Sump-021

Sump 021 is associated with Building B-12 at LHAAP-46. Building B-12 was constructed as a blender building and used for illuminant mixing, 4.2-inch slurry mixing, sound unit composition, flare composition mixing, and hand signal mixing (Plexus, 2005). Potential contaminants at Building B-12 include acetone, aluminum, 2-butanone, barium nitrate, cobalt napthenate, isopropyl alcohol, magnesium, potassium nitrate, potassium perchlorate, silicon, strontium nitrate, vinyl chloride, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-21**.

# 3.22 Sump-022

Sump 022 is associated with Building B-13 at LHAAP-46. Building B-13 was used as a blender building for illuminant drying, continuous illuminant mixing, continuous dry material mixing, M509 grenade manufacturing, and granulate flare composition/slider composition (Plexus, 2005). Potential contaminants at Building B-13 include acetone, fluoroelastomer, magnesium, tetrafluoroethylene (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-22**.

#### 3.23 Sump-023

Sump 023 is associated with Building B-14 at LHAAP-46. Building B-14 was used as a blender building to process the green and yellow flare composition for the manufacturing of signal/smoke/Illumination flares (Plexus, 2005). Potential contaminants include acetone, aluminum,2-butanone, barium nitrate, cobalt napthenate, isopropyl alcohol, magnesium, potassium perchlorate, silicon, sodium nitrate, strontium nitrate, vinyl chloride, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-23**.

# 3.24 Sump-024

Sump 024 is associated with Building B-15 at LHAAP-46. Building B-15 was used as a blender building and for M509 grenade manufacturing, 40mm granulation and drying, and illuminant curing (Plexus, 2005). Potential contaminants at Building B-15 include cesium nitrate, potassium nitrate, and rubidium nitrate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-24**.

# 3.25 Sump-025

Sump 025 is associated with Building B-16 at LHAAP-46. Building B-16 was used as a blender building for propellant consolidation, black powder blending, heat-sealing expelling charges, 40mm delay consolidation, 155mm delay line, metal powders storage, and fuse production (Plexus, 2005). Potential contaminants at Building B-16 include potassium nitrate and sulfur (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-25**.

# 3.26 Sump-026

Sump 026 is associated with Shed C at LHAAP-46. Shed C was used for relay consolidation, heat sealing of expelling charges, black powder dispensing, sewing, expelling charge assembly, sound unit composition weighing and assembly, igniter assembly, and black powder dumping (Plexus, 2005). Potential contaminants at Shed C include potassium nitrate and sulfur (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-26**.

# 3.27 Sump-027

Sump 027 is associated with Building P-9 at LHAAP-46. Building P-9 was used as a bucket washing building for cleaning and degreasing metal parts (Plexus, 2005). Potential contaminants at Building P-9 include acetone, acrylic elastomer, SVOC, VOC (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-27**.

# 3.28 Sump-028

Sump 028 is associated with Building P-122 at LHAAP-46. Building P-122 was used as an oxidizer process building (Plexus, 2005). Potential contaminants are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-28**.

# 3.29 Sump-029

Sump 029 is associated with Building P-123 at LHAAP-46. Building P-123 was used as storage and processing building to weigh/store and transfer magnesium powder (Plexus, 2005). Potential contaminants are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-29**.

#### 3.30 Sump-030

Sump 030 is associated with Building 212-12 at LHAAP-46. Building 212-12 was used to consolidate the Time Train Ring for the M65A1 (60mm) Fuse (Plexus, 2005). Potential contaminants at Building 212-12 include aluminum, magnesium, SVOC, VOC, zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-30**.

# 3.31 Sump-031

Sump 031 is associated with Building 212-12 at LHAAP-46. Building 212-12 was used to consolidate the Time Train Ring for the M65A1 (60mm) Fuse (Plexus, 2005). Potential contaminants at Building 212-12 include aluminum, magnesium, SVOC, VOC, zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-31**.

# 3.32 Sump-032

Sump 032 is associated with Building 212-14 at LHAAP-46. Building 212-14 was used for pressing pyrotechnic mixes, illuminant consolidation, fuse delay consolidation, flare composition, black powder loading, and pellet drilling. Press operations were conducted using a 75-ton hydraulic press (Plexus, 2005). Potential contaminants at Building 212-14 include aluminum, diesel, magnesium, isopropyl alcohol, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-32**.

# 3.33 Sump-033

Sump 033 is associated with Building 212-14 at LHAAP-46. Building 212-14 was used for pressing pyrotechnic mixes, illuminant consolidation, fuse delay consolidation, flare composition, black powder loading, and pellet drilling. Press operations were conducted using a 75-ton hydraulic press (Plexus, 2005). Potential contaminants at Building 212-14 include aluminum, diesel, magnesium, isopropyl alcohol, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-33**.

# 3.34 Sump-034

Sump 034 is associated with Building 212-16 at LHAAP-46. Building 212-16 was used to press M206 pyrotechnic mixes (Plexus, 2005). Potential contaminants at Building 212-16 include magnesium, tetrafluoroethylene, methyl ethyl ketone (MEK), and arsenic (Shaw 2006). Results of soil sample analysis are shown in **Table 3-34**.

# 3.35 Sump-035

Sump 035 is associated with Building 212-18. Building 212-18 was used as a mill for pyrotechnic mixes involving groove and surge and drill and groove operations (Plexus, 2005). Potential contaminants at Building 212-18 include magnesium, tetrafluoroethylene, MEK, and arsenic (Shaw 2006). Results of soil sample analysis are shown in **Table 3-35**.

# 3.36 Sump-036

Sump 036 is associated with Building P-122 at LHAAP-46. Building P-122 was used as an oxidizer process building (Plexus, 2005). Potential contaminants at Building P-122 are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-36**.

# 3.37 Sump-037

Sump 037 is associated with Building 212-29 at LHAAP-46. Building 212-29 was used as a composition surge magazine for the screening and weighing of tetranitrocarbazole (Plexus, 2005). Potential contaminants at Building 212-29 are explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-37**.

# 3.38 Sump-038

Sump 038 is associated with Building 212-32 at LHAAP-46. Building 212-32 was used for pellet grooving (Plexus, 2005). Potential contaminants at Building 212-32 are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-38**.

# 3.39 Sump-039

Sump 039 is associated with Building 212-33 at LHAAP-46. Building 212-33 was used for mixing first fire composition and intermediate charges, red phosphorous smoke mixture and trip flare charges (Plexus, 2005). Potential contaminants at Building 212-33 include acetone, barium chromate, isopropyl alcohol, potassium nitrate, potassium perchlorate, sulfur, SVOC, tungsten VOC (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-39**.

# 3.40 Sump-040

Sump 040 is associated with Building 212-33 at LHAAP-46. Building 212-33 was used for mixing first fire composition and intermediate charges, red phosphorous smoke mixture and trip

flare charges (Plexus, 2005). Potential contaminants at Building 212-33 include acetone, barium chromate, isopropyl alcohol, potassium nitrate, potassium perchlorate, sulfur, SVOC, tungsten VOC (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-40**.

# 3.41 Sump-041

Sump 041 is associated with Building 212-35 at LHAAP-46. Building 212-35 was used for mixing first fire composition and intermediate charges, smoke mixture and trip flare charges (Plexus, 2005). Potential contaminants at Building 212-35 include acetone, barium chromate, boron, magnesium, cesium nitrate, ethyl alcohol, fluoroelastomer copolymer, isopropyl alcohol, potassium nitrate, potassium perchlorate, and rubidium nitrate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-41**.

# 3.42 Sump-042

Sump 042 is associated with Building 212-37 at LHAAP-46. Building 212-37 was used for raw material preparation, intermediate charge and first fire mix, smoke mixture charges and zirconium weighing (Plexus, 2005). Potential contaminants at Building 212-37 include acetone, barium chromate, boron, diesel, isopropyl alcohol, fluoroelastomer copolymer, isopropyl alcohol, magnesium, potassium nitrate, potassium perchlorate, sulfur, SVOCs, VOCs and tungsten (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-42**.

# 3.43 Sump-043

Sump 043 is associated with Building 212-38 at LHAAP-46. Building 212-38 was used for raw material preparation, intermediate charge and first fire mix, smoke mixture charges and zirconium weighing (Plexus, 2005). Potential contaminants at Building 212-38 include cesium nitrate, potassium nitrate, rubidium nitrate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-43**.

# 3.44 Sump-044

Sump 044 is associated with Building 25-C at LHAAP-47. Building 25-C was used as an ammonium perchlorate grinding building (Plexus, 2005). Potential contaminants at Building 25-C include ammonium perchlorate, chlorates, nitrates (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-44**.

# 3.45 Sump-045

Sump 045 is associated with Building 25-C at LHAAP-47. Building 25-C was used as an ammonium perchlorate grinding building (Plexus, 2005). Potential contaminants at Building 25-C include ammonium perchlorate, chlorates, nitrates (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-45**.

# 3.46 Sump-046

00065846

Sump 046 is associated with Building 25-C at LHAAP-47. Building 25-C was used as an ammonium perchlorate grinding building (Plexus, 2005). Potential contaminants at Building 25-C include ammonium perchlorate, chlorates, nitrates (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-46**.

# 3.47 Sump-047

Sump 047 is associated with Building 25-D at LHAAP 47. Building 25-D was used as a blender building and subsequently modified to receive bulk ammonium perchlorate shipments (Plexus, 2005). Potential contaminants at Building 25-D include chlorates, magnesium carbonate, nitrates, perchlorates, and sodium nitrate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-47**.

#### 3.48 Sump-048

Sump 048 is associated with Building 26-E at LHAAP-47. Building 26-E was used as a standardization building for perchlorate handling, mixing and casting composition for the 155-millimeter (mm) rocket assisted projectile, phosphorous weighing and drying, pyrotechnics dispensing, and solvent dispensing (Plexus, 2005). Potential contaminants at Building 26-E include aluminum, chlorates, diesel, isopropyl alcohol, magnesium, magnesium carbonate, nitrates, perchlorates, SVOCs, sodium nitrate, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-48**.

# 3.49 Sump-049

Sump 049 is associated with Building 26-E at LHAAP-47. Building 26-E was used as a standardization building for perchlorate handling, mixing and casting composition for the 155-mm rocket assisted projectile, phosphorous weighing and drying, pyrotechnics dispensing, and solvent dispensing (Plexus, 2005). Potential contaminants at Building 26-E include aluminum, chlorates, diesel, isopropyl alcohol, magnesium, magnesium carbonate, nitrates, perchlorates, SVOCs, sodium nitrate, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-49**.

#### 3.50 Sump-050

Sump 050 is associated with Building 26-E at LHAAP-47. Building 26-E was used as a standardization building for perchlorate handling, mixing and casting composition for the 155-mm rocket assisted projectile, phosphorous weighing and drying, pyrotechnics dispensing, and solvent dispensing (Plexus, 2005). Potential contaminants at Building 26-E include aluminum, chlorates, diesel, isopropyl alcohol, magnesium, magnesium carbonate, nitrates,

perchlorates, SVOCs, VOCs, sodium nitrate, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-50**.

#### 3.51 Sump-051

Sump 051 is associated with Building 26-E at LHAAP-47. Building 26-E was used as a standardization building for perchlorate handling, mixing and casting composition for the 155-mm rocket assisted projectile, phosphorous weighing and drying, pyrotechnics dispensing, and solvent dispensing (Plexus, 2005). Potential contaminants at Building 26-E include Aluminum, chlorates, diesel, isopropyl alcohol, magnesium, magnesium carbonate, nitrates, perchlorates, SVOCs, sodium nitrate, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-51**.

#### *3.52 Sump-052*

Sump 052 is associated with Building 28-G at LHAAP-47. Building 28-G was used as a change house for motor case preparation. Potential contaminants at Building 28-G include SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-52**.

# 3.53 Sump-053

Sump 053 is associated with Building 29-D at LHAAP-47. Building 29-D was used as an oxidizer grinding building (Plexus, 2005). Potential contaminants at Building 29-D include chlorates, magnesium carbonate, nitrates, perchlorates, and sodium nitrate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-53**.

# 3.54 Sump-054

Sump 054 is associated with Building 31-G at LHAAP-47. Building 31-G was used for fuel material preparation, weighing and mixing. (Plexus, 2005). Potential contaminants at Building 31-G include aluminum, magnesium, oxamide, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-54**.

# 3.55 Sump-055

Sump 055 is associated with Building 31-G at LHAAP-47. Building 31-G was used for fuel material preparation, weighing and mixing. (Plexus, 2005). Potential contaminants at Building 31-G include aluminum, magnesium, oxamide, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-55**.

# *3.56 Sump-056*

Sump 056 is associated with Building 32-H at LHAAP-47. Building 32-H was used as a fixture preparation building for cleaning/degreasing metal parts prior to spray coating with Teflon

(Plexus, 2005). Potential contaminants at Building include SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-56**.

# 3.57 Sump-057

Sump 057 is associated with Building 33-G at LHAAP-47. Building 33-G was used as a fuel mixing building. A tank farm was associated with this building (Plexus, 2005). Potential contaminants at Building 33-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-57**.

# 3.58 Sump-058

Sump 058 is associated with Building 36-B at LHAAP-47. Building 36-B was used as a sample preparation building (Plexus, 2005). Potential contaminants at Building 36-B include polybutadiene acrylic acid (PBAA) and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-58**.

# 3.59 Sump-059

Sump 059 is associated with Building 41-E at LHAAP-47. Building 41-E was used as a propellant mixing building (Plexus, 2005). Potential contaminants at Building 41-E include PBAA and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-59**.

# 3.60 Sump-060

Sump 060 is associated with Building 42-E at LHAAP-47. Building 42-E was used for propellant mixing (Plexus, 2005). Potential contaminants at Building include PBAA and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-60**.

# 3.61 Sump-061

Sump 061 is associated with Building 42-H at LHAAP-47. Building 42-H was used for solid rocket propellant production (Plexus, 2005). Potential contaminants at Building include PBAA and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-61**.

# 3.62 Sump-062

Sump 062 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-62**.

# 3.63 Sump-063

Sump 063 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-63**.

# 3.64 Sump-064

Sump 064 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-64**.

# 3.65 Sump-065

Sump 065 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-65**.

# 3.66 Sump-066

Sump 066 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-66**.

# 3.67 Sump-067

Sump 067 is associated with Building 45-E at LHAAP-47. Building 45-E was used as a casting, curing, and finishing building for rocket motors. Lining, patching and caulking of the first and second stage of Pershing Rocket motors was performed in this building (Plexus, 2005). Potential contaminants at Building 45-E include PBAA, polysulfide perchlorate, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-67**.

# 3.68 Sump-068

Sump 068 is associated with Building at LHAAP-47. Building 46-A was used as a casting and curing building for production of PBX explosive propellant (Plexus, 2005). Potential

contaminants at Building 46-A include SVOCs, VOCs, TPH, metals and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-68**.

#### 3.69 Sump-069

Sump 069 is associated with Building 46-B at LHAAP-47. Building 46-Bwas used as a finisher building for motor finishing, initially, and subsequently for propellant mixing (Plexus, 2005). Potential contaminants at Building 46-B include PBAA, polysulfide perchlorate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-69**.

# 3.70 Sump-070

Sump 070 is associated with Building 50-G at LHAAP-47. Building 50-G was used as a cleaning bay to clean/degrease rocket motor parts (Plexus, 2005). Potential contaminants at Building 50-G include diesel, PBAA, polysulfide perchlorate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-70**.

# 3.71 Sump-071

Sump 071 is associated with Building 54-F at LHAAP-47. Building 54-F was used as a motor casting building for casting and curing of motor rockets, illuminant drying, grenade fuse assembly, pellet manufacturing, and flare composition (Plexus, 2005). Potential contaminants at Building 54-F include PBAA and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-71**.

# 3.72 Sump-072

Sump 072 is associated with Building 54-F at LHAAP-47. Building 54-F was used as a motor casting building for casting and curing of motor rockets, pellet coating, ammonium perchlorate grinding and flare composition (Plexus, 2005). Potential contaminants at Building 54-F include PBAA and polysulfide perchlorate (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-72**.

# 3.73 Sump-073

Sump 073 is associated with Building 54-G at LHAAP-47. Building 54-G was used as a motor casting building for casting and curing of motor rockets, illuminant drying, grenade fuse assembly, pellet manufacturing, and flare composition (Plexus, 2005). Potential contaminants at Building 54-G include acetone, diesel, hexane, isopropyl alcohol, magnesium, PBAA, perfluorooctanoic acid, potassium sulfate, polysulfide perchlorate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-73**.

# 3.74 Sump-074

00065851

Sump 074 is associated with Building 54-G at LHAAP-47. Building 54-G was used as a motor casting building for casting and curing of motor rockets, illuminant drying, grenade fuse assembly, pellet manufacturing, and flare composition (Plexus, 2005). Potential contaminants at Building 54-G include acetone, diesel, hexane, isopropyl alcohol, magnesium, PBAA, perfluorooctanoic acid, potassium sulfate, polysulfide perchlorate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-74**.

# 3.75 Sump-075

Sump 075 is associated with Building 54-G at LHAAP-47. Building 54-G was used as a motor casting building for casting and curing of motor rockets, illuminant drying, grenade fuse assembly, pellet manufacturing, and flare composition (Plexus, 2005). Potential contaminants at Building 54-G include acetone, diesel, hexane, isopropyl alcohol, magnesium, PBAA, perfluorooctanoic acid, potassium sulfate, polysulfide perchlorate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-75**.

# 3.76 Sump-076

Sump 076 is associated with Building 54-H at LHAAP-47. Building 54-H was used as a motor casting building for grenade fuse assembly, flare composition, and potassium perchlorate drying (Plexus, 2005). Potential contaminants at Building 54-H include acetone, diesel, hexane, isopropyl alcohol, magnesium, perfluorooctanoic acid, potassium sulfate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-76**.

# 3.77 Sump-077

Sump 077 is associated with Building 54-H at LHAAP-47. Building 54-H was used as a motor casting building for grenade fuse assembly, flare composition, and potassium perchlorate drying (Plexus, 2005). Potential contaminants at Building 54-H include acetone, diesel, hexane, isopropyl alcohol, magnesium, perfluorooctanoic acid, potassium sulfate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-77**.

# 3.78 Sump-078

Sump 078 is associated with Building 68-C at LHAAP-47. Building 68-C was used finishing building for black powder surge, fuse assembly and button bomb manufacturing (Plexus, 2005). Potential contaminants at Building 68-C include red phosphorous, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-78** 

#### 3.79 Sump-079

Sump 079 is associated with Building 68-C at LHAAP-47. Building 68-C was used finishing building for black powder surge, fuse assembly and button bomb manufacturing (Plexus, 2005). Potential contaminants at Building 68-C include red phosphorous, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-79**.

#### 3.80 Sump-080

Sump 080 is associated with Building 68-C at LHAAP-47. Building 68-C was used finishing building for black powder surge, fuse assembly and button bomb manufacturing (Plexus, 2005). Potential contaminants at Building 68-C include red phosphorous, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-80**.

#### 3.81 Sump-081

Sump 081 is associated with Building 68-F at LHAAP-47. Building 68-F was used as a finishing building for assembly and packaging of illuminating mortars, illuminant and aluminum consolidation, fuse rework, first fire dispensing, and consolidation for red phosphorous smoke (Plexus, 2005). Potential contaminants at Building 68-F include metals, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-81**.

#### 3.82 Sump-082

Sump 082 is associated with Building 68-F at LHAAP-47. Building 68-F was used as a finishing building for assembly and packaging of illuminating mortars, illuminant and aluminum consolidation, fuse rework, first fire dispensing, and consolidation for red phosphorous smoke (Plexus, 2005). Potential contaminants at Building 68-F include metals, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-82**.

# 3.83 Sump-083

Sump 083 is associated with Building 68-F at LHAAP-47. Building 68-F was used as a finishing building for assembly and packaging of illuminating mortars, illuminant and aluminum consolidation, fuse rework, first fire dispensing, and consolidation for red phosphorous smoke (Plexus, 2005). Potential contaminants at Building 68-F include metals, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-83**.

# 3.84 Sump-084

Sump 084 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacture of M115 and M116
simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-84**.

# 3.85 Sump-085

Sump 085 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-85** 

# 3.86 Sump-086

Sump 086 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-86**.

# 3.87 Sump-087

Sump 087 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-87**.

# 3.88 Sump-088

Sump 088 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-88**.

# 3.89 Sump-089

Sump 089 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-89**.

# 3.90 Sump-090

00065854

Sump 090 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacture of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-90** 

# 3.91 Sump-091

Sump 091 is associated with Building 75-I at LHAAP-47. Building 75-I was used as a finishing and packing building for cleaning and spray coating motors and parts, black powder drying, pellet extruding, and charge consolidation (Plexus, 2005). Potential contaminants at Building 75-I include aluminum, magnesium, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-91**.

# 3.92 Sump-092

Sump 092 is associated with Building 75-I at LHAAP-47. Building 75-I was used as a finishing and packing building for cleaning and spray coating motors and parts, black powder drying, pellet extruding, and charge consolidation (Plexus, 2005). Potential contaminants at Building 75-I include aluminum, magnesium, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-92** 

# 3.93 Sump-093

Sump 093 is associated with Building 75-I at LHAAP-47. Building 75-I was used as a finishing and packing building for cleaning and spray coating motors and parts, black powder drying, pellet extruding, and charge consolidation (Plexus, 2005). Potential contaminants at Building 75-I include aluminum, magnesium, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-93**.

# 3.94 Sump-106

Sump 106 is associated with Building 401 at LHAAP-66. Building 401 is a gas powered heating plant/power house located at LHAAP-66 (Plexus, 2005). Potential contaminants at Building 401 include metals, VOCs, SVOCs and polychlorinated biphenyls (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-94**.

# *3.95 Sump-107*

Sump 107 is associated with Building 403 at LHAAP-46. Building 403 was used as a pyrotechnic production operations building for pyrotechnic material pressing, pellet consolidation and charge assembly (Plexus, 2005). Potential contaminants at Building 403

include ethyl acetate and magnesium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-95**.

### 3.96 Sump-108

Sump 108 is associated with Building 406 at LHAAP-46. Building 406 was used as a chemical process building (Plexus, 2005). Potential contaminants at Building 406 include metals and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-96**.

# 3.97 Sump-109

Sump 109 is associated with Building 408 at LHAAP-46. Building 408 was used as a mixing and pressing building for pyrotechnic items loading, assembly and packing (Plexus, 2005). Potential contaminants at Building 408 include perchlorates, metals, and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-97**.

# 3.98 Sump-110

Sump 110 is associated with Building 207 at LHAAP-46. Building 207 was used as a maintenance calibration facility and as a research and development laboratory for a smoke test device (Plexus, 2005). Potential contaminants at Building 207 include metals, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-98**.

# 3.99 Sump-111

Sump 111 is associated with Building 722-P at LHAAP-35A. Building 722-P was used as a paint shop (Plexus, 2005). Potential contaminants at Building 722-P include metals, SVOCs, VOCs and TPH diesel range organic-gasoline range organic (DRO-GRO) (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-99**.

# 3.100 Sump-112

Sump 112 is associated with Building 722-P at LHAAP-35A. Building 722-P was used as a paint shop (Plexus, 2005). Potential contaminants at Building 722-P include metals, SVOCs, VOCs and TPH DRO-GRO (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-100**.

# 3.101 Sump-113

Sump 113 is associated with Building 744 at LHAAP-35A. Building 744 was used as a service station in association with a grease rack at Building 744-A. (Plexus, 2005). Potential contaminants at Building 744 are unknown. For Building 744-A potential contaminants include metals, SVOCs, VOCs and TPH DRO-GRO (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-101**.

# 3.102 Sump-114

Sump 114 is associated with Building 25-X at LHAAP-39. Building 25-X was used as a cleaning slab and pit for cleaning containers that once carried explosive waste (Plexus, 2005). Potential contaminants at Building 25-X include VOCs, SVOCs, and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-102**.

# 3.103 Sump-115

Sump 115 is associated with Building 33-X at LHAAP-18. Building 33-X was used as a general-purpose storage shed (Plexus, 2005). Potential contaminants at Building 33-X are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-103**.

# 3.104 Sump-116

Sump 116 is associated with Building 37-X at LHAAP-18. Building 37-X was used as an air curtain destructor (Plexus, 2005). Potential contaminants at Building 37-X are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-104**.

# 3.105 Sump-117

Sump 117 is associated with Building 744-A at LHAAP-58. Building 744-A was used as a grease rack (Plexus, 2005). Potential contaminants at Building 744-A include metals, SVOCs, VOCs, and TPH DRO-GRO (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-105**.

# 3.106 Sump-118

Sump 118 is associated with Building 813, an independent production facility located northwest of LHAAP-29. Building 813 was used for assembly of pyrotechnic items (Plexus, 2005). Potential contaminants at Building 813 include SVOCs, VOCs, and TPH DRO-GRO (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-106**.

# 3.107 Sump-121

Sump 121 is associated with Building 32-H at LHAAP-47. Building 32-H was used as a fixture preparation building spray coating metal parts with Teflon, and degreasing with trichloroethylene, and Teflon curing in ovens (Plexus, 2005). Potential contaminants at Building 32-H include SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-107**.

# 3.108 Sump-122

Sump 122 is associated with Building 401-C at LHAAP-04. Building 401-C was used for wastewater storage (Plexus, 2005). Potential contaminants at Building 401-C include metals,

SVOCs, VOCs, TPH DRO-GRO, herbicides and pesticides (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-108**.

# 3.109 Sump-125

Sump 125 is associated with Building 723 at LHAAP-58. Building 723 was used as a fixed laundry facility (Plexus, 2005). Potential contaminants at Building 723 include chlorinated solvents (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-109**.

# 3.110 WRSump-004

WRSUMP004 is associated with Building P-1 at LHAAP-46. Building P-1 was used as an aluminum weighing building. The building stored metal powders used in the manufacturing of the Atomic Explosion Simulator and signal/smoke flares (Plexus, 2005). Potential contaminants at Building P-1 include aluminum, boron, hexamethylenetetramine, magnesium, vinyl chloride, silicon, tungsten, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-110**.

# 3.111 WRSump-005

WRSUMP005 is associated with Building P-117 at LHAAP-46. Building P-117 was used as a mixing and consolidation building for illuminant consolidation, sodium nitrate handling, 60/81mm pressing, and magnesium powder mixing. Mixers were cleaned using sawdust with methylene chloride (Plexus, 2005). Potential contaminants at Building P-117 include VOCs, SVOCs, explosives and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-111**.

# 3.112 WRSump-006

WRSUMP006 is associated with Building P-118 at LHAAP-46. Building P-118 was used as a small pyrotechnic item manufacturing building for pyrotechnic cartridge manufacturing involving sodium nitrate grinding, magnesium handling, trip flare consolidation, first fire dispensing, decontamination kit hand line operations, and pellet coating (Plexus, 2005). Potential contaminants at Building P-118 include acetone, diesel, isopropyl alcohol, SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-112**.

# 3.113 WRSump-007

WRSUMP007 is associated with Building P-122 at LHAAP-46. Building P-122 was used as an oxidizer process building (Plexus, 2005). Potential contaminants are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-113**.

# 3.114 WRSump-008

WRSUMP008 is associated with Building B-8 at LHAAP-46. Building B-8 was used as a blender building for production of the M21 Simulator and pyrotechnic material blending (Plexus, 2005). Potential contaminants at Building B-8 include explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-114**.

# 3.115 WRSump-009

WRSUMP009 is associated with Building S-113 at LHAAP-46. Potential contaminants at Building S-113 include SVOCs, VOCs, explosives and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-115**.

# 3.116 WRSump-010

WRSUMP010 is associated with Building P-12 at LHAAP-46. Building P-12 was used for pyrotechnic production. Potential contaminants at Building P-12 include SVOCs, VOCs, explosives and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-116**.

# 3.117 WRSump-011

WRSUMP011 is associated with Building B-13 at LHAAP-46. Building B-13 was used as a blender building for illuminant composition (Plexus, 2005). Potential contaminants at Building B-13 include SVOCs and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-117**.

# 3.118 WRSump-012

WRSUMP012 is associated with Building P-113 at LHAAP-46. Building B-13 was used as a blender building for illuminant drying, continuous illuminant mixing, continuous dry material mixing, M509 grenade manufacturing, and granulate flare composition/slider composition (Plexus, 2005). Potential contaminants at Building B-13 include acetone, fluoroelastomer, magnesium, tetrafluoroethylene (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-118**.

# 3.119 WRSump-013

WRSUMP013 is associated with LHAAP-45, the Magazine Area, which is described as a munitions storage area with a total area of more than 800 acres consisting of 58 bunkers. The bunkers were used to store munitions products, and was in use from 1942 through 1995. WRSUMP013 is located in the vicinity of the loading dock area near bunker 811-50 outside the southwest site boundary of LHAAP-45 (Plexus, 2005). Results of soil sample analysis are shown in **Table 3-119**.

# 3.120 WRSump-014

WRSUMP014 is associated with Building 29-A at LHAAP-37. Building 29-A was used control and chemistry lab for raw material testing and some bench-scale production (Plexus, 2005). Potential contaminants at Building 29-A include SVOCs, VOCs, metals and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-120**.

# 3.121 WRSump-015

WRSUMP015 is associated with Building 212-14 at LHAAP-15. Building 212-14 was used for pressing pyrotechnic mixes, illuminant consolidation, fuse delay consolidation, flare composition, black powder loading, and pellet drilling. Press operations were conducted using a 75-ton hydraulic press (Plexus, 2005). Potential contaminants at Building 212-14 include aluminum, diesel, magnesium, isopropyl alcohol, SVOCs, VOCs, and zirconium (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-121**.

# 3.122 WRSump-016

WRSUMP016 is associated with Building 407 at LHAAP-46. Building 407 was used for illuminant testing (Plexus, 2005). Potential contaminants at Building 407 include SVOCs, VOCs and metals (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-122**.

# 3.123 WRSump-017

WRSUMP017 is associated with Building 68-G at LHAAP-47. Building 68-G was used as a finishing building for button bomb loading and assembly, practice rocket manufacturing, first fire and black powder dispensing, rocket fuse testing and manufacturing of M115 and M116 simulators (Plexus, 2005). Potential contaminants at Building 68-G are unknown (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-123**.

# 3.124 WRSump-018

WRSUMP018 is associated with Building 54-H at LHAAP-47. Building 54-H was used as a motor casting building for grenade fuse assembly, flare composition, and potassium perchlorate drying (Plexus, 2005). Potential contaminants at Building 54-H include acetone, diesel, hexane, isopropyl alcohol, magnesium, perfluorooctanoic acid, potassium sulfate, SVOCs, and VOCs (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-124**.

# 3.125 WRSump-019

WRSUMP019 is associated with Building 212-20 at LHAAP-19. Building 212-20 was used for pyrotechnic production (Plexus, 2005). Potential contaminants at Building 212-20 include SVOCs, VOCs, TPH, metals and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-125**.

# 3.126 WRSump-021

WRSUMP021 is associated with Building P-11 at LHAAP-46. Building P-11 was used for pyrotechnic production (Plexus, 2005). Potential contaminants at Building P-11 include SVOCs, VOCs, TPH, metals and explosives (Shaw, 2006). Results of soil sample analysis are shown in **Table 3-126**.

# 4.0 Data Evaluation

Chemicals of potential concern (COPCs) for possible further consideration at LHAAP-35/36 were identified from the results shown in **Tables 3-1** through **3-126** by following criteria provided in the TCEQ Risk Reduction Rule (RRR) given in Title 30 of the Texas Administrative Code Chapter 335 (30 TAC §335).

Analytical data were evaluated as follows:

- Samples with all validation qualifiers were included in the residential risk assessment except for "R"-qualified data, which were rejected from the data set.
- "U"- qualified data indicate undetected concentrations below the method detection limit (MDL) shown
- "J"- qualified data indicate estimated concentrations detected with concentrations measured between the MDL and the method quantitation limit (MQL) value shown
- "E"- qualified data indicate measurements exceeding the upper calibration limit, therefore, the concentration is estimated.

Samples collected prior to 2002 were evaluated in previous risk assessments (Jacobs, 2002b; 2003). Because potential health risks associated with these samples have been evaluated, and were found to be within acceptable limits, they are not evaluated in this document. This evaluation addresses additional samples collected in 2006 at selected sumps, where adequate data was previously not available, to determine whether the soil around the sumps posed human health risk.

The COPCs for the LHAAP-35/36 soil evaluation were identified using risk-based screening criteria developed from 30 TAC §335 and subsequent guidance (TCEQ, 1998, 2001, 2003) to identify chemicals that would contribute significantly to human health risk.

Data from soil near former sump locations were grouped according to LHAAP sites and Sub-Areas (**Figures 2-1** through **2-6**) to identify and evaluate COPCs. This grouping allows the evaluation of COPCs at sump locations in the context of previous assessments, and is consistent with the objective to determine whether the additional data would change the conclusions of previous risk assessments (**Section 1.1**).

# 4.1 Risk-Based Screening

Essential human nutrients (calcium, chloride, iron, magnesium, potassium, and sodium) were eliminated from further consideration as COPCs (TCEQ, 1998, 2001, 2003).

A risk-based screening step was used to identify chemicals that would contribute significantly to human health risk. The RBSVs used are given in TCEQ (1998) guidance and in tables included in this chapter (TCEQ, 2006). The RBSVs are concentrations that are protective of human health exposure via ingestion, inhalation, and dermal absorption pathways at a 1E-06 target risk level for carcinogens and a 0.1 target hazard quotient for noncarcinogens. In cases where contaminants have both carcinogenic and noncancer toxicity factors, the RBSV represents the lower (more conservative) value. The RBSVs are protective of both residential and commercial/industrial land-use scenarios.

The RBSV values for TPH components analyzed according to TCEQ Method TX1005 were developed as follows:

- For results reported as "Carbon Range C12-C28 and Carbon Range C28-C35" concentrations, the value used is the lowest of RBSVs for >12-16 C, >16-21 C, and >21-35 C (aromatic) boiling fraction of TPH, given in TCEQ (2006) guidance (4.0E+02 milligrams per kilogram [mg/kg]).
- For results reported as "Carbon Range C6-C12" concentrations, the value used is the RBSV for the >8C-C10 (aromatic) boiling fraction of TPH, given in TCEQ (2006) guidance (1.7E+02 mg/kg).

# 4.1.1 Definitions

Terms used in this report to describe concentrations at or near the detection limit are defined as follows:

*Practical quantitation limit (PQL). The PQL* is the concentration of the lowest non-zero standard in the laboratory's calibration curve adjusted for laboratory reagent matrix type and sample size. The PQL is analogous to the MQL reported by the laboratory and described in Section 7 of SW846-Method 8000B. The PQL is used under the 30 TAC 335 rule to evaluate the capability of the analytical method used by the laboratory to quantitate the chemicals at concentrations below a regulatory level.

When the PQL of the most sensitive standard available method is greater than the regulatory level, the PQL from that method is used as the regulatory limit in lieu of the regulatory level as allowed in 30 TAC 335.

Sample quantitation limit (SQL). The SQL is the PQL adjusted for sample-specific factors affecting the quantitation of the chemical measured in an environmental sample, such as dilution or moisture content, and flagged with a "U" qualifier to indicate the chemical was not detected in the in the sample. Some samples required dilution to quantitate a chemical initially present at high concentrations that exceeded the linear range of instrument response. Other dilutions were required by matrix interference, (e.g., soil properties that interfere with an extraction step, or an

extract that could not be evaporated down to the required 1mL volume before analysis). For such samples, the analyst prepares samples with increasing dilution factors. The analytical results are reported for the lowest dilution that provides measurements within the linear response range, and meets quality control criteria. The diluted samples are identified in Section 4 tables by showing the dilution factor for each sample.

*Method detection limit (MDL).* The MDL the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from the analysis of a sample in a given matrix type containing the analyte (TCEQ, 1998, Appendix B.1.1.2).

The laboratory establishes the MDL for the chemical and verifies the value on at least a quarterly basis using a detectability check sample (DCS) to demonstrate that the laboratory can detect the chemical at that MDL. The DCS is a laboratory reagent grade matrix sample spiked with the chemical at or within two times the laboratory's MDL and carried through the entire sample preparation and analysis procedures.

*Sample detection limit (SDL).* The SDL is the laboratory's MDL for the chemical adjusted for sample-specific factors affecting the detection of the chemical measured in an environmental sample, such as dilution or percent moisture, and flagged or qualified with a "U" or "<" to indicate the chemical was not detected in the sample. As agreed upon between the TCEQ and LHAAP during a May 17, 2007 telephone conference, the SDL is used in this document to report nondetected results for chemicals only when the PQL is being used as the regulatory limit for the chemical.

*Method Quantitation Limit.* The MQL is the concentration of the lowest non-zero standard in the laboratory's calibration curve. MQL values that were provided by the analytical laboratory for its quality assurance program, and which meets the SW-846 requirements for the method (USEPA, 1997) were used in the screening step.

*Background.* For metals, a screening comparison to LHAAP background concentrations was used to determine whether detected metal concentrations might be related to LHAAP operations or naturally occurring background levels. The LHAAP-specific background concentrations for soil were developed using data that represent background concentrations for surface soil (0-0.5 feet bgs) and subsurface soil (1.5-2.5 feet bgs) (Shaw, 2004b). Because the samples collected at LHAAP-35/36 sumps were taken at several depth intervals, the depth interval of surface and subsurface samples for sumps and background soil data do not correspond exactly. Therefore, the LHAAP-35/36 concentrations were compared to the lower of surface and subsurface background concentrations. This approach provides a more conservative evaluation.

Based on TCEQ recommendations, 95% upper prediction limits (UPLs) of the background data sets (Shaw, 2004b) were calculated and used in this evaluation. The 95% UPL value represents the concentration that will be above the next single measurement with 95 percent confidence, and was calculated as follows.

The distributions of background concentrations are shown in the original soil background document (Shaw, 2004b) and are repeated in **Table 4-1**. If the background data have either the normal or lognormal distribution the 95% UPL was calculated according to the equation (USEPA, 1992):

UPL<sub>0.95</sub> = X + 
$$t_{n-1,0.95}$$
 x S x  $(1+1/n)^{1/2}$  Equation 1

where:

| I             | UPL <sub>0.95</sub> | = | the 95% UPL   |
|---------------|---------------------|---|---|
| 2             | X                   | = | mean background concentration                               |
| t<br>confider | n-1,0.95            | = | Student's t value for n-1 degrees of freedom and 95 percent |
| S             | 5                   | = | standard deviation of the mean                              |

n = number of samples

If the data were shown to be both normally and lognormally distributed, the distribution having the higher p value above 0.05 was used for the 95% UPL calculation. If the data were lognormally distributed, the 95% UPL value used (**Table 4-1**) is the antilogarithm of the value calculated by Equation 1.

Nonparametric methods were used if the data do not have either the normal or lognormal distribution. The 95% UPL concentration was determined by ranking the data from highest to lowest and calculating the 95<sup>th</sup> percentile rank according to the equation:

$$UPL_{0.95} = 95^{th}$$
 percentile = 0.95(n+1) Equation 2

where:

 $UPL_{0.95}$  = concentration occupying the 95<sup>th</sup> percentile rank

 $95^{\text{th}}$  percentile = the  $95^{\text{th}}$  percentile rank of the data set

n = number of samples

This 95<sup>th</sup> percentile is the same as the 95% UPL according to the assumptions made in Equation 1.

The applicable RBSVs used for screening were developed according to TCEQ (1998) guidance and current tables (TCEQ, 2006). For chemicals having a PQL or the background concentration higher than the RBSV, the higher of the PQL or background concentration was chosen as the applicable RBSV for the chemical, as described in §335.563(j)(1) for Risk Reduction Standard 3.

The soil screening step involves comparison of the detected concentration to the applicable RBSV. Chemicals with detected concentrations equal to or below the applicable RBSV levels were eliminated from further evaluation. Chemicals having concentrations above the applicable RBSV were further evaluated to determine whether they would contribute significantly to the risk estimates for the LHAAP site provided in the Jacobs (2002b, 2003) risk assessments.

Screening of data for chemical concentrations in soil are shown in tables below. A master footnote and abbreviation legend that applies to all data evaluation tables is provided with the tables. The SVOC compounds that exceed the applicable RBSV as a result of dilution are indicated in the screening tables by shading.

# 4.2 Site LHAAP-46 (Sub-Area 1)

Locations of sumps associated with LHAAP-46 are shown in **Figure 2-1**. Evaluations of data for soil from LHAAP-46 are shown in **Tables 4-1** through **4-60**. A master footnote and abbreviation legend is provided with the tables.

# 4.2.1 Sump-001

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-1**. All chemicals except vanadium and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS04-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs, even though the SVOCs were not detected in the sample. The evaluation of vanadium is described in **Section 4.3**.

# 4.2.2 Sump-002

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-2**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the

Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

### 4.2.3 Sump-003

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-3**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.4 Sump-004

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-4**. All chemicals except vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of vanadium is described in **Section 4.3**.

# 4.2.5 Sump-005

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-5**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-005.

# 4.2.6 Sump-006

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-6**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.7 Sump-007

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-7**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.8 Sump-008

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-8**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further

consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRSMP005-SB01-01 was diluted by a factor of 5, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.9 Sump-009

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-9**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRSMP005-SB01-01 was diluted by a factor of 5, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.10 Sump-010

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-10**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-010.

# 4.2.11 Sump-011

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-11**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-011.

# 4.2.12 Sump-012

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-12**. All chemicals except selected SVOCs had concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS06-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQLs, even though the SVOCs were not detected in the sample.

# 4.2.13 Sump-013

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-13**. All chemicals except selected SVOCs had concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the

baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS06-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQLs, even though the SVOCs were not detected in the sample.

# 4.2.14 Sump-014

Soil samples from the Sump-014 location were analyzed for perchlorate in 2002 (**Table 4-14**). Because all chemicals had concentrations below the RBSV level, no further action is required at Sump-014.

# 4.2.15 Sump-015

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-15**. Because all chemicals had concentrations below the RBSV level, no further action is required at Sump-015.

# 4.2.16 Sump-016

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-16**. Because all chemicals had concentrations below the RBSV level, no further action is required at Sump-015.

# 4.2.17 Sump-017

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-17**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.18 Sump-018

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-18**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS10-SB02-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

### 4.2.19 Sump-019

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-19**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-019.

### 4.2.20 Sump-020

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-20**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-020.

### 4.2.21 Sump-021

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-21**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

### 4.2.22 Sump-022

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-22**. All chemicals except arsenic, vanadium, and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS10-SB02-01 was diluted by a factor of 2, which resulted in an elevation of the SQL value for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of arsenic and vanadium is described in **Section 4.3**.

# 4.2.23 Sump-023

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-23**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-023.

### 4.2.24 Sump-024

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-24**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.25 Sump-025

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-25**. All chemicals except aluminum have concentrations below the RBSV, and were removed from

further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.26 Sump-026

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-26a**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.27 Sump-027

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-27**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-027.

# 4.2.28 Sump-028

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-28**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-028.

# 4.2.29 Sump-029

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-29**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-029.

# 4.2.30 Sumps-030

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-30**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.31 Sump-031

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-31**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.32 Sump -032

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-32**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-032.

### 4.2.33 Sump-033

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-33**. All chemicals except aluminum, vanadium, and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Samples WRS06-SB01-01 and WRS-015-SB01-01 were diluted by a factor of 10, and sample WRS-015-SB02-01 was diluted by a factor of 20, which resulted in an elevation of the SQL for SVOCs above the MQLs, even though the SVOCs were not detected in the sample. The evaluation of aluminum and vanadium is described in **Section 4.3**.

### 4.2.34 Sump-034

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-34**. All chemicals except aluminum, vanadium, and selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS-015-SB01-01 was diluted by a factor of 10 and WRS-015-SB02-01 was diluted by a factor of 20, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum and vanadium is described in **Section 4.3**.

### 4.2.35 Sump-035

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-35**. All chemicals except mercury have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of mercury is described in **Section 4.3**.

### 4.2.36 Sump-036

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-36**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-036.

# 4.2.37 Sump-037

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-37**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS10-SB02-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.38 Sump-038

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-38**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-038.

# 4.2.39 Sump-039

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-39**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-039.

# 4.2.40 Sump-040

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-40**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-040.

# 4.2.41 Sump-041

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-41**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-041.

# 4.2.42 Sump-042

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-42**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.43 Sump-043

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-43.** Because all chemicals have concentrations below the RBSV, no further action is required at Sump-043.

# 4.2.44 Sump-107

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-44.** Because all chemicals have concentrations below the RBSV, no further action is required at Sump-107.

# 4.2.45 Sump-108

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-45**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-108.

### 4.2.46 Sump-109

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-46.** Because all chemicals have concentrations below the RBSV, no further action is required at Sump-109.

### 4.2.47 Sump-110

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-47**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-110.

### 4.2.48 WRSump-004

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-48**. All chemicals except for vanadium and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS04-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of vanadium is described in **Section 4.3**.

### 4.2.49 WRSump-005

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-49**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRSMP005-SB01-01 was diluted by a factor of 5, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

#### 4.2.50 WRSump-006

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-50**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample (WRS06-SB01-01) was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample.

#### 4.2.51 WRSump-007

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-51**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from

further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS07-SB02-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample.

# 4.2.52 WRSump-008

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-52**. Because all chemicals have concentrations below the RBSV, no further action is required at WRSump-008.

# 4.2.53 WRSump-009

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-53**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS09-SB02-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample.

# 4.2.54 WRSump-010

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-54**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS10-SB02-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.55 WRSump-011

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-55**. All chemicals except aluminum and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Samples WRS011-SB01-01 and WRS011-SB01-01 were diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum is described in **Section 4.3**.

# 4.2.56 WRSump-012

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-56**. Because all chemicals have concentrations below the RBSV, no further action is required at WRSump-012.

# 4.2.57 WRSump-015

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-57**. All chemicals except aluminum, vanadium, and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample WRS-015-SB01-01 was diluted by a factor of 10 and WRS-15-SB02-01 was diluted by a factor of 20, which resulted in an elevation of the MQL, which resulted in an elevation of the SQL value for the SVOCs above the MQL, even though the SVOCs were not detected in the sample. The evaluation of aluminum and vanadium is described in **Section 4.3**.

# 4.2.58 WRSump-016

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-58.** All chemicals except vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1.** The evaluation of vanadium is described in **Section 4.3.** 

# 4.2.59 WRSump-019

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-59**. All chemicals except vanadium and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

WRS019-SB01-01, WRS019-SB01-01-QC, WRS019-SB02-01 were diluted by a factor of 5, which resulted in an elevation of the MQL for SVOCs, even though the SVOCs were not detected in the sample. The evaluation of vanadium is described in **Section 4.3**.

# 4.2.60 WRSump-021

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-60**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Data Evaluation Report

# 00065876

WRS021-SB01-01 was diluted by a factor of 10 and WRS021-SB02-01 was diluted by a factor of 20, which resulted in an elevation of the MQL for the SVOCs, even though the SVOCs were not detected in the sample.

# 4.3 Evaluation of Risks from Chemicals Exceeding RBSVs in Post-2002 Samples at LHAAP-46 Sumps

Screening of chemical concentrations in soil at LHAAP-46 indicates that concentrations of aluminum, arsenic, mercury, or vanadium were quantitated in one or more samples at concentrations above RBSV levels (**Tables 4-1** through **4-60**). The analytical results for these metals in all soil samples from sump locations where a metal concentration exceeds the RBSV in at least one sample are summarized in **Table 4-61**, which shows the mean, standard deviation, sample size, and the 95% upper confidence limit (UCL) of the mean. All concentrations detected above the MDL (J-qualified values), and the full value of the SQL representing a proxy values for concentrations. Bootstrapping (Efron and Tibshirani, 1993) is among the statistical methods described in USEPA (2002) guidance for calculating UCLs and exposure point concentrations (EPCs) for use in risk assessments.

The Jacobs (2003) risk assessment for LHAAP-46 evaluated future maintenance exposures to chemicals in soil by the ingestion, inhalation, and dermal contact pathways. That risk assessment calculated pathway Incremental Lifetime Cancer Risk (ILCR) values and Hazard Index (HI) values for each metal; and the total soil ILCR and HI values for exposures to all chemicals by all exposure pathways.

# 4.3.1 Arsenic

Because arsenic was not identified as a COPC in the Jacobs (2003) risk assessment for LHAAP-46, ILCR and HI values were calculated for the future maintenance worker exposure to arsenic in soil using the EPC values developed from post-2002 samples (**Table 4-61**). Risk and hazard estimates were calculated using the equations, exposure factors, toxicity factors, and physical and chemical properties provided in TCEQ (1998) guidance as updated through March 2006. Site-specific properties were used as indicated in the calculations. The calculations of ILCR and HI values for arsenic are shown in **Tables 4-62** through **4-65**, and are summarized in **Table 4-66**.

# 4.3.2 Aluminum, Mercury, and Vanadium

Aluminum, mercury, and vanadium were evaluated in the Jacobs (2003) risk assessment for LHAAP-46 that evaluated exposures to soil by the ingestion, inhalation, and dermal contact pathways. Because these three metals are noncarcinogens, all human health risks from worker exposures to soil are evaluated in the calculated pathway HI for each metal, and the total soil HI calculated for exposures to all chemicals in soil by all exposure pathways.

The pathway HI values for each metal given in the Jacobs (2003) risk assessment, and the total soil HI values for all chemicals and all exposure pathways are summarized in **Table 4-66b**. The post-2002 EPC concentration of mercury is less than the EPC evaluated in the Jacobs (2003) assessment. Therefore, the post-2002 mercury concentration would not increase the HI values reported in the Jacobs (2003) assessment.

The post-2002 EPC concentration of aluminum (1.17E+04 mg/kg) is greater than the Jacobs (2003) EPC (8.07E+03 mg/kg) (see **Table 4-66b**). The calculated HI for exposure of a future maintenance worker to aluminum in soil at a concentration of 8.07E+03 mg/kg was 1.30E-02 (Jacobs, 2003). Therefore, the estimated post-2002 HI for exposure of a future worker to aluminum in soil is 1.3E-02 x 1.17E+04 mg/kg / 8.07E+03 mg/kg = 1.89E-02, which represents a net increase in the HI of 1.89E-02 - 1.30E-02 = 5.9E-03 (**Table 4-66b**).

The post-2002 EPC concentration of vanadium (3.03E+01 mg/kg) is greater than the Jacobs (2003) EPC (2.89E+01 mg/kg) (see **Table 4-66b**). The calculated HI for exposure of a future maintenance worker to vanadium in soil at a concentration of 2.89E+01 mg/kg was 1.40E-02 (Jacobs, 2003). Therefore, the estimated post-2002 HI for exposure of a future worker to vanadium in soil is  $1.40E-02 \times 3.03E+01 \text{ mg/kg}/2.89E+01 \text{ mg/kg} = 1.47E-02$ , which represents a net increase in the HI of 1.47E-02 - 1.40E-02 = 6.7E-04 (see **Table 4-66b**).

# 4.3.3 Summary

Application of the arsenic concentrations reported for post-2002 soil samples to the Jacobs (2003) risk assessment would increase the Jacobs (2003) ILCR estimate from 1.7E-05 to 1.8E-05 (**Table 4-66a**), which is still within the acceptable risk range of 1E-06 to 1E-04 (USEPA, 1994) and within the risk range established in 30TAC§335.563(b).

Application of the aluminum, mercury, and vanadium concentrations reported for post-2002 soil samples to the Jacobs (2003) risk assessment would increase the Jacobs (2003) HI estimate from 1.2E-01 to 1.8E-01 (**Table 4-66b**), which is still below the acceptable maximum HI of 1 [USEPA, 1994; 30TAC§335.563(c)].

Because it is demonstrated that EPC values developed using post-2002 sampling results contribute negligible increases to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, and all concentrations of other chemicals are below the RBSV values, no further action is required for the soil around the sumps at LHAAP-46.

# 4.4 Site LHAAP-47 (Sub-Area 2)

Locations of sumps associated with LHAAP-47 are shown in **Figure 2-2**. Evaluations of data for soil from LHAAP-47 are shown in **Tables 4-67** through **4-113**. Refer to the Master Footnote and Abbreviation Legend for a description of notes and abbreviations.

### 4.4.1 Sump-044

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-67**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-044.

### 4.4.2 Sump-045

Because there were no samples collected since 2003 at the Sump-045 locations, and risks associated with samples collected prior to 2003 were evaluated in the Jacobs (2003) risk assessment, no further action is required at Sump-045.

### 4.4.3 Sump-046

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-68**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-046.

### 4.4.4 Sump-047

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-69**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-047.

### 4.4.5 Sump-048

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-70**. All chemicals except mercury have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of mercury is described in **Section 4.5**.

### 4.4.6 Sump-049

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-71**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-049.

### 4.4.7 Sump-050

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-72**. All chemicals except vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of vanadium is described in **Section 4.5**.

### 4.4.8 Sump-051

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-73**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-051.

### 4.4.9 Sump-052

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-74**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-052.

### 4.4.10 Sump-053

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-75**. All chemicals except vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of vanadium is described in **Section 4.5**.

### 4.4.11 Sump-054

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-76**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-054.

### 4.4.12 Sump-055

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-77**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-055.

### 4.4.13 Sump-056

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-78**. All chemicals except selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample 35-SMP056-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL for the SVOCs above the MQLs, even though the SVOCs were not detected in the sample.

#### 4.4.14 Sump-057

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-79**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-057.

#### 4.4.15 Sump-058

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-80**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-058.

### 4.4.16 Sump-059

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-81**. Because chemicals have concentrations below the RBSV, no further action is required at Sump-059.

# 4.4.17 Sump-060

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-82**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-060.

# 4.4.18 Sump-061

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-83**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-061.

# 4.4.19 Sump-062

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

### 4.4.20 Sump-063

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

# 4.4.21 Sump-064

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-84.** All chemicals except selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample 35-SMP064-SB01-01 was diluted by a factor of 5 which resulted in an elevation of the SQL for the SVOCs above the MQLs, even though the SVOCs were not detected in the sample.

# 4.4.22 Sump-065

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-85**. All chemicals except selected SVOCs have concentrations below the RBSV. The chemicals having soil concentrations below RBSV concentrations were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample 35-SMP064-SB01-01 was diluted by a factor of 5, which resulted in an elevation of the SQL above the MQL, even though the SVOCs were not detected in the sample.

# 4.4.23 Sump-066

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-86**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-066.

# 4.4.24 Sump-067

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-87**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-067.

# 4.4.25 Sump-068

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

# 4.4.26 Sump-069

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-88**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-069.

# 4.4.27 Sump-070

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-89**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-070.

# 4.4.28 Sump-071

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-90**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-071.

### 4.4.29 Sump-072

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-91**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-072.

# 4.4.30 Sump-073

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-92**. All chemicals except mercury have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of mercury is described in **Section 4.5**.

### 4.4.31 Sump-074

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-93**. All chemicals except manganese and selected SVOCs have concentrations below the RBSV and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of mercury is described in **Section 4.5**.

Sample 35-SMP074-SB02-01 was diluted by a factor of 5, which resulted in an elevation of the SQL above the MQL, even though the SVOCs were not detected in the sample.

# 4.4.32 Sump-075

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-94**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-075.

# 4.4.33 Sump-076

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-95**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-076.

# 4.4.34 Sump-077

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-96**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.5**.

# 4.4.35 Sump-078

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

# 4.4.36 Sump-079

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

# 4.4.37 Sump-080

Soil samples associated with this sump were collected prior to 2001 and evaluated in the Jacobs (2003) risk assessment, and are not reevaluated in this document.

# 4.4.38 Sump-081

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-97**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

# 4.4.39 Sump-082

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-98**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

#### 4.4.40 Sump-083

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-99**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

### 4.4.41 Sump-084

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-100**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

### 4.4.42 Sump-085

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-101**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-085.

#### 4.4.43 Sump-086

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-102**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

### 4.4.44 Sump-087

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-103**. All chemicals except aluminum and vanadium have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

### 4.4.45 Sump-088

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-104**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1** 

Samples 35-SMP088-SB01-01 and 35-SMP088-SB02-01 were diluted by a factor of 5, which resulted in an elevation of the SQL above the MQL, even though the SVOCs were not detected in the sample.

# 4.4.46 Sump-089

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-105**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-089.

# 4.4.47 Sump-090

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-106**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-090.

# 4.4.48 Sump-091

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-107**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.5**.

# 4.4.49 Sump-092

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-108**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-092.

# 4.4.50 Sump-093

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-109**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-093.

# 4.4.51 Sump-121

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-110**. All chemicals except selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**.

Sample 35-SMP121-SB01-02 was diluted by a factor of 20, which resulted in an elevation of the SQL above the MQL, even though the SVOCs were not detected in the sample.

# 4.4.52 WRSump-014

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-111**. All chemicals except vanadium and selected SVOCs have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical

relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of vanadium is described in **Section 4.5**.

Sample WRS14-SB01-01 was diluted by a factor of 10, which resulted in an elevation of the SQL above the MQL, even though the SVOCs were not detected in the sample.

# 4.4.53 WRSump-017

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-112**. All chemicals except aluminum have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum is described in **Section 4.5**.

# 4.4.54 WRSump-018

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-113**. All chemicals except aluminum and vanadium have concentrations below the RBSV and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of aluminum and vanadium is described in **Section 4.5**.

# 4.5 Evaluation of Risks from Chemicals Exceeding RBSVs in Post-2002 Samples at LHAAP-47 Sumps

Screening of chemical concentrations in soil at LHAAP-47 indicates that concentrations of aluminum, mercury, manganese or vanadium were quantitated in one or more samples at concentrations above RBSV levels (**Tables 4-67** through **4-113**). The analytical results for these metals in all soil samples from sump locations where a metal concentration exceeds the RBSV in at least one sample are summarized in **Table 4-114**, which shows the mean, standard deviation, sample size, and the 95% UCL of the mean. All concentrations detected above the MDL (J-qualified values), and the full value of the SQL representing a proxy value for concentrations reported as not detected (U-qualified) concentrations were used in all statistical calculations. Bootstrapping (Efron and Tibshirani, 1993) is among the statistical methods described in USEPA (2002) guidance for calculating UCLs and EPCs for use in risk assessments.

The Jacobs (2003) risk assessment for LHAAP-47 evaluated future maintenance exposures to chemicals in soil by the ingestion, inhalation, and dermal contact pathways. That risk assessment calculated pathway ILCR values and HI values for each metal; and the total soil ILCR and HI values for exposures to all chemicals by all exposure pathways.

Because aluminum, mercury, manganese, and vanadium are noncarcinogens, application of the concentrations of these metals reported for post-2002 soil samples to the Jacobs (2003) risk assessment would not increase the Jacobs (2003) ILCR estimate for LHAAP-47 (**Table 4-115a**).

Aluminum, manganese, mercury, and vanadium were evaluated in the Jacobs (2003) risk assessment for LHAAP-47 that evaluated exposures to soil by the ingestion, inhalation, and dermal contact pathways. Because these four metals are noncarcinogens, all human health risks from worker exposures to soil are evaluated in the calculated pathway HI for each metal, and the total soil HI calculated for exposures to all chemicals in soil by all exposure pathways.

The pathway HI values for each metal given in the Jacobs (2003) risk assessment, and the total soil HI values for all chemicals and all exposure pathways are summarized in **Table 4-115b**. The Post-2003 EPC concentration of manganese, mercury, and vanadium are less than the EPC evaluated in the Jacobs (2003) assessment. Therefore, the post-2002 concentrations of these metals would not increase the HI values reported in the Jacobs (2003) assessment.

The post-2002 EPC concentration of aluminum (1.25E+04 mg/kg) is greater than the Jacobs (2003) EPC (8.82+03 mg/kg) (see **Table 4-115**). The calculated HI for exposure of a future maintenance worker to aluminum in soil at a concentration of 8.82E+03 mg/kg was 1.50E-02 (Jacobs, 2003). Therefore, the estimated post-2002 HI for exposure of a future worker to aluminum in soil is  $1.5E-02 \times 1.25E+04$  mg/kg / 8.82E+03 mg/kg = 2.12E-02, which represents a net increase in the HI of 2.12E-02 - 1.50E-02 = 6.21E-03 (**Table 4-115b**).

# 4.5.1 Summary

Application of the aluminum, manganese, mercury, and vanadium concentrations reported for post-2002 soil samples to the Jacobs (2003) risk assessment would increase the Jacobs (2003) HI estimate from 4.6E-01 to 4.7E-01 (**Table 4-115b**), which is still below the acceptable maximum HI of 1 [USEPA, 1994; 30TAC§335.563(c)]. None of these metals are carcinogens; therefore, there is no impact to the ILCR from these metals.

Because it is demonstrated that EPC values developed using post-2002 sampling results contribute negligible increases to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, and all concentrations of other chemicals are below the RBSV values, no further action is required for the soil around sumps at LHAAP-47.

# 4.6 Sites LHAAP-04, 35A(58), 60, 66, and 68 (Sub-Area 3)

Locations of sumps associated with LHAAP-04, 35A(58), 60, 66, and 68 are shown in **Figure 2-3**. Evaluations of data for soil from these sites are shown in **Tables 4-116** through **4-121**. Refer to the Master Footnote and Abbreviation Legend for a description of notes and abbreviations.

# 4.6.1 Sump-106

Soil samples associated with Sump-106 are identical to those associated with Sump-084 (see Section 4.4.41).

### 4.6.2 Sump-111

Sump-111 was located at LHAAP-35A(58) (**Figure 2-3**). Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-116**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-111.

### 4.6.3 Sump-112

Sump-112 was located at LHAAP-35A(58) (**Figure 2-3**). Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-117**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-112.

### 4.6.4 Sump-113

Sump-113 was located at LHAAP-35A(58) (**Figure 2-3**). Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-118**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-113.

### 4.6.5 Sump-117

Sump-117 was located at LHAAP-35A(58) (**Figure 2-3**). Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-119**. All chemicals except manganese have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of manganese is described in **Section 4.10**.

# 4.6.6 Sump-125

Sump-125 was located at LHAAP-35A(58) (**Figure 2-3**). Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-120**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-125.

# 4.7 Sites LHAAP-18, and 39 (Sub-Area 4)

Locations of sumps associated with LHAAP-18 and 39 are shown in **Figure 2-4**. Evaluations of data for soil from these sites are shown in **Tables 4-121** through **4-123**. Refer to the Master Footnote and Abbreviation Legend for a description of notes and abbreviations.

# 4.7.1 Sump-114

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-121**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-114.

# 4.7.2 Sump-115

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-122**. All chemicals except six SVOCs have concentrations below the RBSV.

# 4.7.3 Sump-116

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-123**. All chemicals except vanadium, selected SVOCs, trichloroethene (TCE), and vinyl chloride have concentrations below the RBSV, and were removed from further consideration in the baseline risk assessment evaluation of the chemical relative to the Jacobs (2003) risk assessment as described in **Section 1.1**. The evaluation of vanadium is described in **Section 4.5**. The evaluation of vanadium, TCE, and vinyl chloride are described in **Section 4.10**.

# 4.8 Site LHAAP-29 (Sub-Area 5, Part 1 of 2)

The location of the sump near LHAAP-29 is shown in **Figure 2-5**. Evaluations of data for soil from this site are shown in **Table 4-124**. Refer to the Master Legend for a description of notes and abbreviations.

# 4.8.1 Sump-118

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-124**. Because all chemicals have concentrations below the RBSV, no further action is required at Sump-118.

# 4.9 Site LHAAP-45 (Sub-Area 5, Part 2 of 2)

Locations of sump associated with LHAAP-45 are shown in **Figure 2-6**. Evaluations of data for soil from this site are shown in **Table 4-126**. Refer to the Master Legend for a description of notes and abbreviations.

# 4.9.1 WRSump-013

Screening of soil concentrations versus RBSV concentrations is shown in **Table 4-125**. All chemicals except six SVOCs have concentrations below the RBSV.

# 4.10 Evaluation of Risks from Chemicals Exceeding RBSVs in Post-2002 Samples at Sub-Areas 3 and 4

Screening of chemical concentrations in soil at Sub-Areas 3 and 4 indicates a few chemicals with concentrations above the RBSV level in isolated samples.

Manganese was quantitated at a concentration above the RBSV in sample 35-SMP117-SB01-02, located near Sump-117 at LHAAP-35A(58) (**Table 4-119**). Manganese was not identified as a COPC in previous risk assessments at LHAAP-35A(58) (Jacobs, 2003).
Vanadium was quantitated at a concentration above the RBSV in sample 35-SMP116-SB01-01 located near Sump-116 at LHAAP-18/24, and samples 35-SMP116-SB01-02 and 35-SMP116-SB02-02 had detected or estimated (J-qualified) concentrations of TCE and vinyl chloride above RBSV values (**Table 4-123**). Vanadium, TCE, and vinyl chloride were not identified as COPCs in previous risk assessments at LHAAP-18/24 (Jacobs, 2002a).

## 4.10.1 Evaluation of Manganese Quantitated at LHAAP-35A(58)

Because manganese was not identified as a COPC in the Jacobs (2003) risk assessment for LHAAP-35A(58), ILCR and HI values were calculated for the future maintenance worker exposure to manganese in soil using the single concentration quantitated above the RBSV (**Table 4-119**). Risk and hazard estimates were calculated using the equations, exposure factors, toxicity factors, and physical chemical properties provided in TCEQ (1998) guidance as updated through March 2006. Site-specific properties were used as indicated in the calculations. The calculations of ILCR and HI values for arsenic are shown in **Tables 4-126** through **4-129**, and are summarized in **Table 4-130**.

Because manganese is a noncarcinogen, application of the maximum quantitated manganese concentration reported for post-2002 soil samples (**Table 4-119**) to the Jacobs (2003) risk assessment would not affect the Jacobs (2003) ILCR estimate for LHAAP-35A(58) (**Table 4-129a**), which is within the acceptable risk range of 1E-06 to 1E-04 (USEPA, 1994) and within the risk range established in 30TAC§335.563(b).

Application of the manganese concentration to the Jacobs (2003) risk assessment would increase the Jacobs (2003) HI estimate from 4.7E-01 to 5.9E-01 (**Table 4-130b**), which is still below the acceptable maximum HI of 1 [USEPA, 1994; 30TAC§335.563(c)].

Because it is demonstrated that maximum quantitated manganese concentration measured in soil from Post-2003 sampling events contributes negligible increase to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, and all concentrations of other chemicals are below the RBSV values, no further action is required for soil associated with sumps at LHAAP-35A(58).

## 4.10.2 Evaluation of Vanadium, Tetrachloroethene, and Vinyl Chloride at LHAAP-18/24

Because vanadium, TCE, and vinyl chloride were not identified as a COPC in the Jacobs (2002c) risk assessment for LHAAP-18/24, ILCR and HI values were calculated for the future maintenance worker exposure to these chemicals in soil using the maximum concentrations quantitated above the RBSV (**Table 4-123**).

Risk and hazard estimates were calculated using the equations, exposure factors, toxicity factors, and physical chemical properties provided in TCEQ (1998) guidance as updated through March

2006. The calculations of ILCR and HI values for arsenic are shown in **Tables 4-131** through **4-134**.

The total soil ILCR and HI values for exposure of a future maintenance worker to all chemicals and all exposure pathways given in the Jacobs (2002c) risk assessment are summarized in **Table 4-135**. Because LHAAP-18/24 has undergone interim action, the Jacobs (2002c) risk assessment was based on two scenarios; Scenario 1 was based on an EPC that included two samples collected within the 5,000-foot interception trench and Scenario 2 that excluded these samples. Only negligible differences were reported for these two scenarios; the ILCR estimates for the two scenarios are identical, and the HI values are 4.2E-02 and 3.8E-02 for Scenarios 1 and 2, respectively. The HI calculated for Scenario 1 is used in the following discussion.

### 4.10.3 Summary

Application of the ILCR values calculated for vanadium, TCE and vinyl chloride concentrations to the pre-2002 risk assessment would increase the Jacobs (2002b) ILCR estimate from 5.0E-07 to 7.5E-05 (**Table 4-135a**), which is within the acceptable risk range of 1E-06 to 1E-04 (USEPA, 1994) and within the risk range established in 30TAC§335.563(b).

Application of the HI values calculated for the three chemicals to the pre-2002 risk assessment would increase the Jacobs (2002c) HI estimate from 4.2E-02 to 3.5E-01 (**Table 4-135b**), which is still below the acceptable maximum HI of 1 [USEPA, 1994; 30TAC§335.563(c)].

Because it is demonstrated that EPC values developed using post-2002 sampling results contribute negligible increases to the Jacobs (2002c) risk assessment cancer risk and noncancer hazard values, and all concentrations of other chemicals are below the RBSV values, no further action is required for soil associated with sumps at LHAAP-18/24.

## 5.0 Summary and Conclusions

Previous risk assessments (Jacobs, 2002b, 2003) indicated acceptable risk to an industrial worker from exposure to chemicals in soil from sites LHAAP-18/24, 46, 47, and 35A(58). Soil associated with former wastewater sumps near process facilities at these sites, and others, have been collectively designated as LHAAP-35/36. Data collected prior to 2002 were included in the previous assessments and were not evaluated here. The approach followed in this report is to first present post-2002 data for each sump followed by a comparison of the data to available RBSVs. If an exceedance of an RBSV is noted for a chemical, the chemical is then evaluated with respect to the risk assessment (Jacobs 2002b; 2003) for the site within which the sump lies.

Application of the aluminum, arsenic, mercury, and vanadium concentrations reported for post-2002 soil samples collected near sumps associated with LHAAP-46 to the Jacobs (2003) LHAAP-46 risk assessment contributed negligible increases to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, with resultant values still in the acceptable range. Therefore, no further action is required for the soil around sumps at LHAAP-46.

Application of the aluminum, mercury, manganese, and vanadium concentrations reported for Post-2003 soil samples collected near sumps associated with LHAAP-47 to the Jacobs (2003) LHAAP-47 risk assessment contributed negligible increases to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, with resultant values still in the acceptable range. Therefore, no further action is required for soil around sumps at LHAAP-47.

Application of the maximum manganese concentration measured in soil near sumps associated with LHAAP-35A(58) to the Jacobs (2003) LHAAP-35A(58) risk assessment contributed negligible increases to the Jacobs (2003) risk assessment cancer risk and noncancer hazard values, with resultant values still in the acceptable range. Therefore, no further action is required for soil around sumps at LHAAP-35A(58).

Application of the vanadium, TCE, and vinyl chloride concentrations measured in soil near sumps associated with LHAAP-18/24 to the Jacobs (2003) LHAAP-18/24 risk assessment contributed negligible increases to the Jacobs (2002b) risk assessment cancer risk and noncancer hazard values, with resultant values still in the acceptable range. Therefore, no further action is required for soil around sumps at LHAAP-18/24.

There are no LHAAP-35/36 sump locations associated with LHAAP-04, -29, -39, or -66 (see **Figures 2-3** through **2-6**) that had chemicals with concentrations in soil exceeding RBSVs.

Because it is demonstrated that post-2002 sampling results contribute negligible increases to the previous risk assessments, and the cancer risk and noncancer hazard values are well within the acceptable ranges, no further action is required for soil associated with sumps at LHAAP-35/36.

## FINAL DATA EVALUATION REPORT CHEMICAL CONCENTRATIONS IN SOIL SAMPLES ASSOCIATED WITH LHAAP-35/36 SUMPS LONGHORN ARMY AMMUNITION PLANT KARNACK, TEXAS

## **VOLUME II OF III: TABLES FOR SECTIONS 1.0 AND 3.0**

Prepared for U.S. Army Corps of Engineers Tulsa District 1645 South 101st East Avenue Tulsa, Oklahoma

Prepared by Shaw Environmental, Inc. 3010 Briarpark, Suite 400 Houston, Texas 77042

Contract No. W12QR-04-D-0027, Task Order No. DS02 Shaw Project No. 117591

January 2008

**Tables** 

#### Master Footnote and Abbreviation List

- <sup>a</sup> Value provided by the Texas Commission on Environmental Quality (TCEQ) as updated through March 2006 available on the TCEQ website at <a href="http://www.tceq.state.tx.us/assets/public/remediation/rrr/msc-rbscn\_2006.xls">http://www.tceq.state.tx.us/assets/public/remediation/rrr/msc-rbscn\_2006.xls</a>.
- 1,2-Dichloroethene = Value shown is lower of the cis- or trans-1,2-dichloroethene values.

95% UPL = Upper Prediction Limit of background concentration

Background Concentrations = Lower of surface and subsurface soil background concentrations used in these comparisons.

#### Boxed and bold = Concentration exceeds Applicable RBSV

Carbon Range C12-C28 = Value shown is the lowest of >12-16C, >16-21 C, and >21-35 C (aromatic) boiling fraction of total petroleum hydrocarbons RBSVs given in TCEQ March 2006 guidance.

Carbon Range C12-C28 = Value shown is the RBSV for the >8C-10C (aromatic) boiling fraction of total petroleum hydrocarbons given in TCEQ March 2006 guidance. m- or p- xylene = Value shown is the lower of m-, or p-xylene values given in TCEQ March 2006 guidance.

Shading indicates value equal to MDL modified by dilution and percent solids factors for chemicals that are undetected and have an applicable RBSV equal to the MQL. Weight of Evidence = EPA designator indicating that chemical is a known human carcinogen (A) or not a human carcinogen (D).

- D Analyte was quantified as a secondary dilution factor
- DIL dilution factor
- FD Field duplicate sample
- Ft feet
- H Estimate is high
- J Estimated value. Chemical was detected above the method detection limit but below the MQL.
- L Estimate is low
- LQ laboratory qualifier
- MDL Method Detection Limit
- MQL Method Quantitation Limit
- mg/kg milligrams per kilogram
- mg/I milligrams per liter
- NA Not applicable
- NE Value not established.
- RBSV risk based screening value
- REG Regular sample
- U Compound validated as not detected above MQL shown
- VQ data validator qualifier

Notes:

<sup>a</sup> Soil samples from sump locations were evaluated in this report unless stated otherwise.

NA not applicable

TBD to be determined

Comments:

1 No samples were collected at this location for this evaluation as described in Addendum 7 of the Work Plan (Shaw, 2006).

2 Soil samples from this location were included in the site evaluation report for LHAAP-48 and LHAAP-35C(53).

3 Sump location close to Sump084 such that soil samples collected at Sump084 characterize Sump106 also.

4 Soil samples from this location were included in the site evaluation report for LHAAP-59.

5 Sump was never used.
